Type IIB vacua from G-theory

Based on: arXiv: 1411.4786, 1411.4787

Introduction

Framework Examples

Conclusions

Turning on fluxes implies that the internal manifold is of a generalized type.

- A supersymmetric solution of the motion equations implies that the KSE are satisfied.
- By using the pure spinor formalism we can extract topological information about the compact space.
- The fluxes of the global solutions are entirely codified in the geometry of a auxiliary K3 fibration over CP¹.

Type IIB vacua from G-theory

Based on: arXiv: 1411.4786, 1411.4787

Introduction

Framework Examples

Low energy limit of Type IIB string theory

$$S = \frac{1}{2\kappa_{10}} \int d^{10}x \sqrt{-g} \left(e^{-2\phi} \left[R + (\nabla\phi)^2 - \frac{1}{6}H^2 \right] - \frac{1}{2}F_1^2 - \frac{1}{12}F_3^2 - \frac{1}{120}F_5^2 \right) - \frac{1}{4\kappa_{10}} \int C_4 \wedge H_3 \wedge F_3$$

where $H=dB,\ F_n=d_HC=dC-H\wedge C$ and the Bianchi identities are

$$dH = 0, \quad d_H F = 0 \tag{1}$$

3/11

Framework

Type IIB vacua from G-theory

Based on: arXiv: 1411.4786, 1411.4787

Introduction

Framework

Examples

Conclusions

A particularly elegant form of the KSE is given by

$$d_H(e^{3A-\phi}\Phi_1) = 0 \tag{2}$$

$$d_H(e^{2A-\phi}\mathsf{Re}\Phi_2) = 0 \tag{3}$$

$$d_H(e^{4A-\phi} \mathsf{Im}\Phi_2) = \frac{e^{4A}}{8} * \lambda(F) \,, \tag{4}$$

which specify two nowhere vanishing polyforms ¹

$$\Phi_1 = -\frac{1}{8}K \wedge \left(\sin\alpha \ e^{-ij} + i\cos\alpha \ \Omega_2\right)$$
$$\Phi_2 = \frac{e^{-i\theta}}{8}e^{\frac{1}{2}K\wedge\bar{K}}\left(\cos\alpha \ e^{-ij} - i\sin\alpha \ \Omega_2\right)$$
(5)

¹The SU(2) structure can be embedded into SU(3) via $J = j + \frac{i}{2}K \wedge \bar{K}, \ \Omega_3 = K \wedge \Omega_2$ (1) $I = j + \frac{i}{2}K \wedge \bar{K}, \ \Omega_3 = K \wedge \Omega_2$ (4/11)

Solution class A

Type IIB vacua from G-theory

Based on: arXiv: 1411.4786, 1411.4787

ntroductio

Framework

Examples

Conclusions

lpha=0, $heta=\pi/2$

$$\Phi_1 = -\frac{\mathrm{i}}{8}\Omega_3 \quad \Phi_2 = -\frac{\mathrm{i}}{8}e^{-\mathrm{i}J} \tag{6}$$

The Eqs. (2-4) leads to

$$d(e^{3A-\phi}\Omega_3) = d(e^{2A-\phi}J) = H \wedge J = H \wedge \Omega = 0$$
 (7)

$$dC_4 - dB \wedge C_2 = \frac{1}{2} d^c [e^{\phi - 4A} \, \hat{J} \wedge \hat{J}]$$
$$dC_2 - C_0 \, dB = e^{-\phi} d^c B$$
$$dC_0 = -d^c e^{-\phi}$$

Conclusions

Type IIB vacua from G-theory

- Based on: arXiv: 1411.4786, 1411.4787
- ntroduction
- Framework
- Examples
- Conclusions

- We presented explicit solutions where the ten-dimensional spacetime takes the local form $\mathbb{R}^{1,3} \times M_4 \times \Sigma$, with M_4 a generalized complex manifold with SU(2) structure and Σ an open subset of \mathbb{C} .
 - We display explicit examples for $M_4 = T^4$ specified by up to four holomorphic functions. These solutions can be viewed as supersymmetric solutions of $\mathcal{N} = (2, 2)$ maximal supergravity in six dimensions with a set of scalar fields varying over the *z*-plane.
