

Crab Nebula with HEALpix

T. Brinckmann, D. Castelão, D. Hooper, S. Vagnozzi

Extracting flux from Crab Nebula

- 1: Locate Crab Nebula (SIMBAD)
- 2: Convert galactic coordinates to vector coord.
- 3: Choose HEALpix parameters
 - Nside = 512, Scheme = Nested
- 4: Use HEALpix to extract information

WMAP Ka band – 5yr data

Map we are using: full Sky WMAP Ka band (26.5–40 GHz)

CRAB as seen by WMAP-Ka

1.5 "/p>>

(184.558,-5.784)

First calculation with no corrections

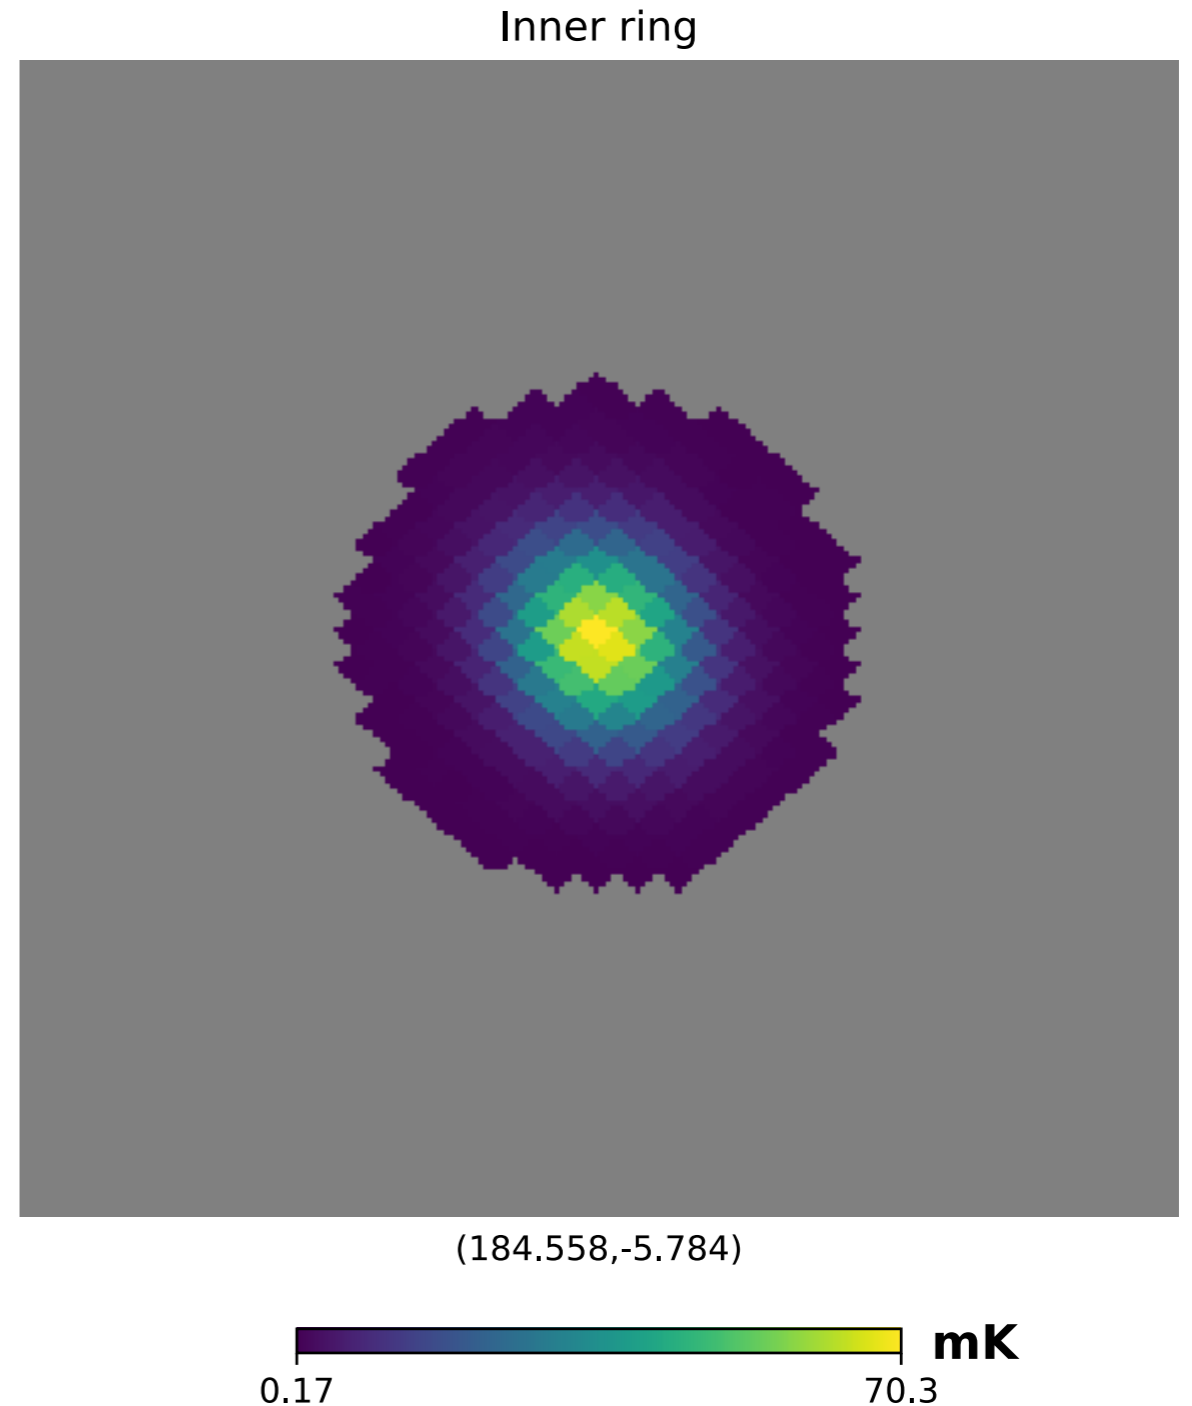

Source

- > Define 1deg aperture
- > Use HEALpix to get temperature
- > Use Rayleigh-Jeans law to get flux

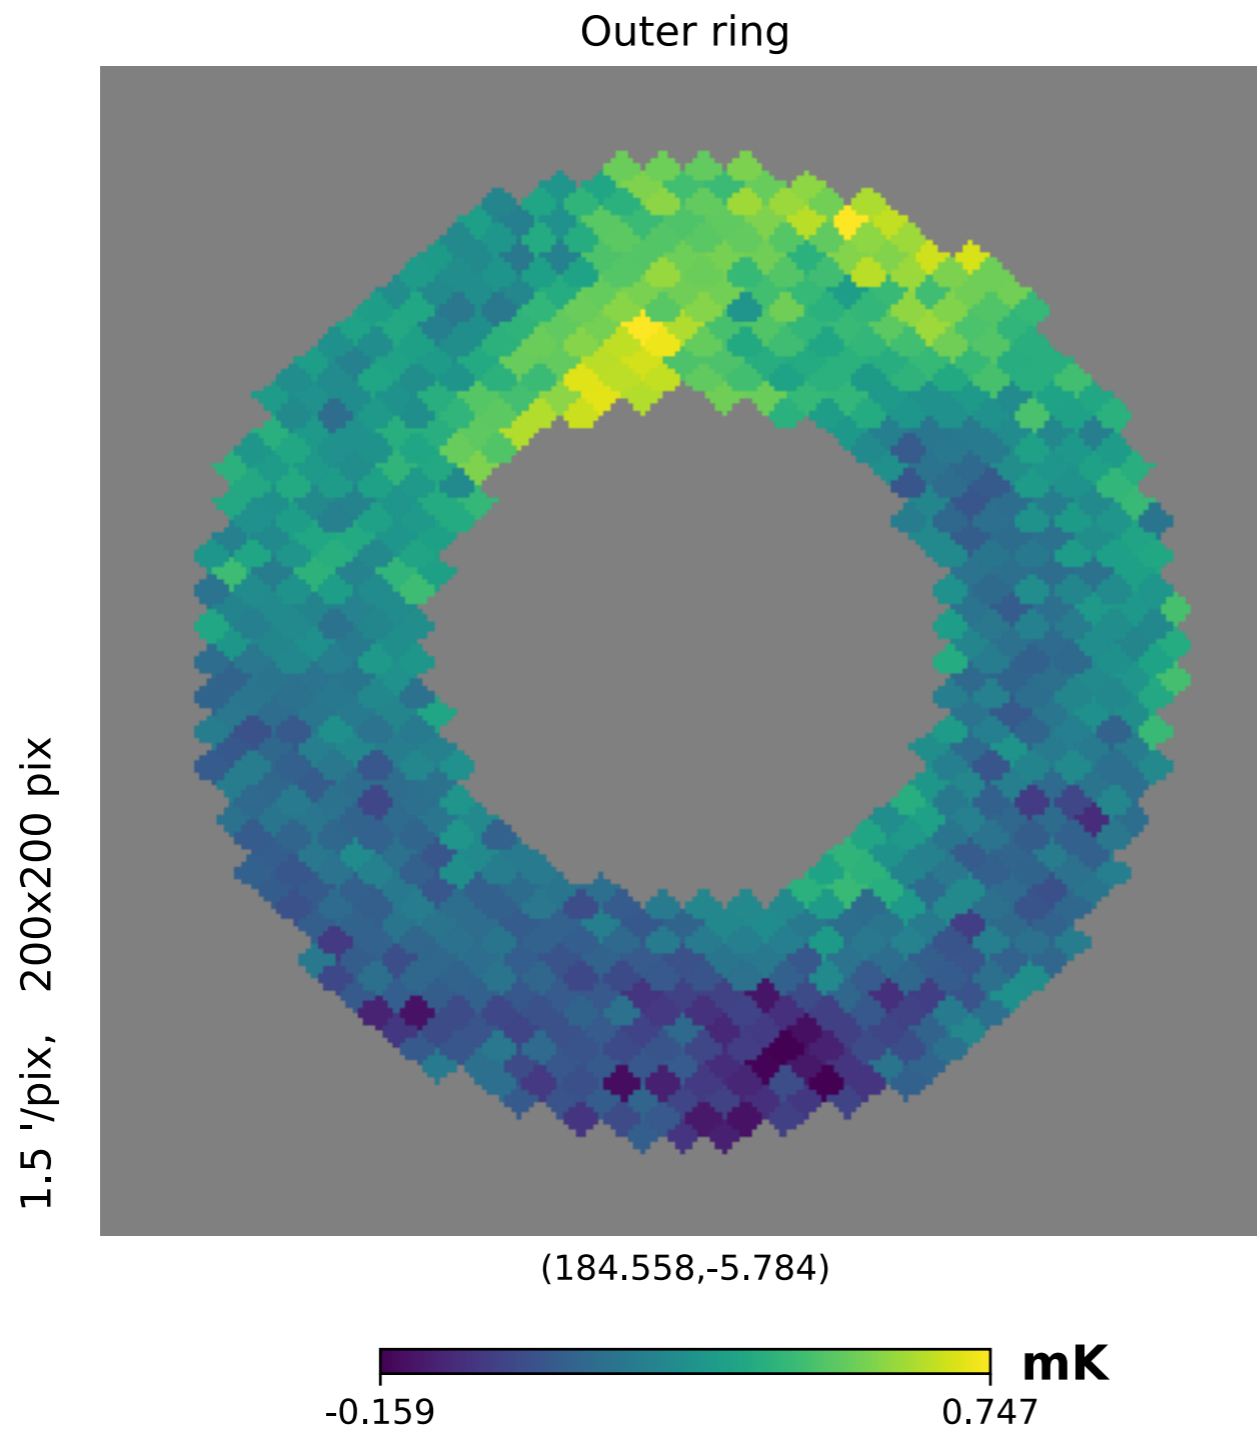

$$B_\nu(T) = \frac{2\nu^2 k_B T}{c^2}.$$

- > Flux without correction = 344.9 Jy

1.5 "/pix, 200x200 pix

Second estimate considering background

Background

- > 2 deg aperture
- > Extract average temp using HEALpix
- > Subtract background from source
- > Corrected flux $F = 334.7$ Jy
- > Published value: Page et al. (2003) value using WMAP: 322 ± 6 Jy

What is missing?

Final result using Black Body Spectrum

- Rayleigh Jeans law is low frequency approximation
- Use full black body spectrum

$$B_\nu(T) = \frac{2h\nu^3}{c^2} \frac{1}{e^{\frac{h\nu}{k_B T}} - 1} \approx \frac{2h\nu^3}{c^2} \cdot \frac{k_B T}{h\nu} = \frac{2\nu^2 k_B T}{c^2}$$

- Final result: $F = 325.5 \text{ Jy}$
(to be compared with $F = 322 \pm 6 \text{ Jy}$)
- We were able to reproduce published value!
