

XXIX IFT Christmas Workshop

12-14 December 2018 Madrid

Highlights from LHC

Martine Bosman

Reference talks – ICHEP2018

- [ATLAS + ALICE highlights T. Carli](#)
- [CMS + LHCb highlights S. Rahatlou](#)
- [Higgs experimental summary G. Piacquadio](#)
- [EW/SM/Top summary L. Skinnari](#)
- [SUSY summary S. Strandberg](#)
- [EXOTICS at the LHC D. del Re](#)
- [CKM& CPV \(Quark Flavour\) Ph. Urquijo](#)
- etc.

LHC performance and recorded data

Instantaneous luminosity reached $2 \cdot 10^{34} \text{cm}^{-2} \text{s}^{-1}$ in ATLAS and CMS

LHCb collected in

- Run1 3 fb⁻¹
- Run2 6 fb⁻¹

2015-17 data ~80 fb⁻¹
2015-16 data ~36 fb⁻¹

Running conditions & detector performance

- mitigate the effect of pile-up
- MC should describe the impact on data with high precision

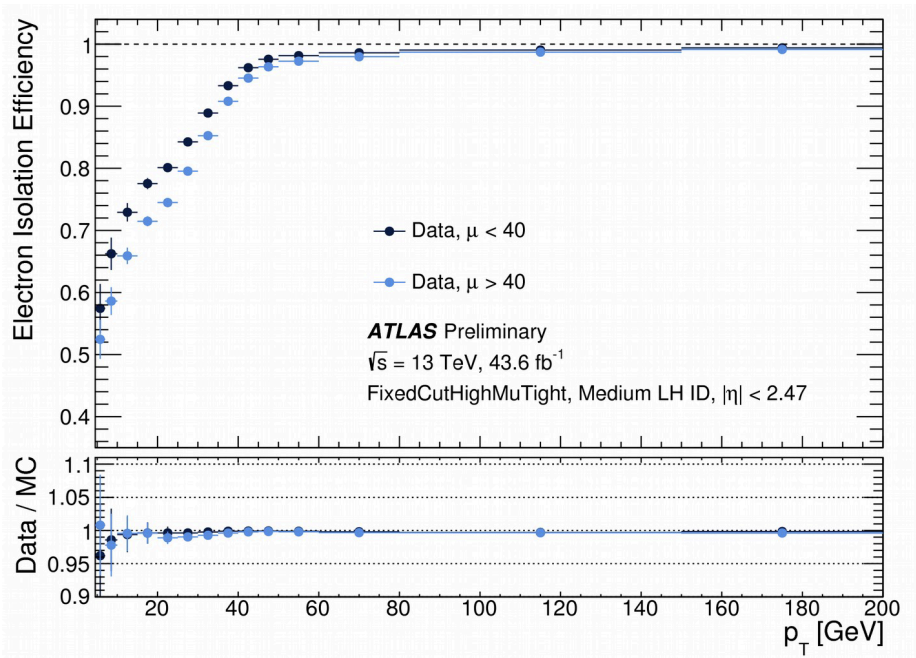

example: $Z \rightarrow e^+e^-$

[electron calibration](#)

per mil effect well described by MC

Running conditions & detector performance

[electron isolation](#)

[Number of b-tagged jets in a high purity \$t\bar{t}\$ sample](#)

new analysis techniques, jet substructure

Boosted jet variables (substructures and flavor tagging) with images, deep learning and more detailed algorithms

W jets

QCD jets

some examples: [Phys. Rev. D 98, 092005](https://arxiv.org/abs/1806.05442)

[Luke de Oliveira, et al, JHEP 07 \(2016\) 069](#)

Higgs physics

[Phys.lett.B 775 \(2017\) 1](#)

[ATLAS-CONF-2018-018](#)

Time to study the properties of the new fundamental scalar!

Is it a Standard Model Higgs boson?

Standard Model Higgs boson

$$\mathcal{L} = -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} + i \bar{\psi} \not{D} \psi + h.c.$$

describes experimental data until 2012 discovery

$$+ \bar{\psi}_i y_{ij} \psi_j \phi + h.c.$$

Higgs sector

$$+ |D_\mu \phi|^2 - V(\phi)$$

$$+ \mathcal{L}_{new} ?$$

Yukawa coupling with new scalar
new type of interaction

Gauge boson interaction with new scalar
(known for fermions)

Higgs potential
 $\mu^2 \phi^2 + \lambda^2 \phi^2$
to be explored at HL-LHC

LHC Run 1 legacy

- Higgs boson **mass** measured to $\sim 0.2\%$
(fixes the SM predictions!)
- Higgs boson **couplings** measured to $\sim 10\text{-}25\%$
($H \rightarrow \text{invisible}$ constrained to $< 25\text{-}30\%$)
- First studies of **spin, CP eigenstate/
admixtures, differential distributions**, all
compatible with the SM

More precision is needed

- Coupling to fermions not fully established yet in Run-1
coupling to top and bottom quarks not directly observed
- Generic size of (inclusive) Higgs couplings modifiers expected for new physics (BSM) at $\sim O(\text{TeV})$

Model	κ_V	κ_b	κ_γ
Singlet Mixing	$\sim 6\%$	$\sim 6\%$	$\sim 6\%$
2HDM	$\sim 1\%$	$\sim 10\%$	$\sim 1\%$
Decoupling MSSM	$\sim -0.0013\%$	$\sim 1.6\%$	$\sim -0.4\%$
Composite	$\sim -3\%$	$\sim -(3 - 9)\%$	$\sim -9\%$
Top Partner	$\sim -2\%$	$\sim -2\%$	$\sim +1\%$

[Snowmass 2013 study,
<https://arxiv.org/pdf/1310.8361.pdf>]

N.B. BSM effects may be enhanced at high transverse momentum, in tails of distribution

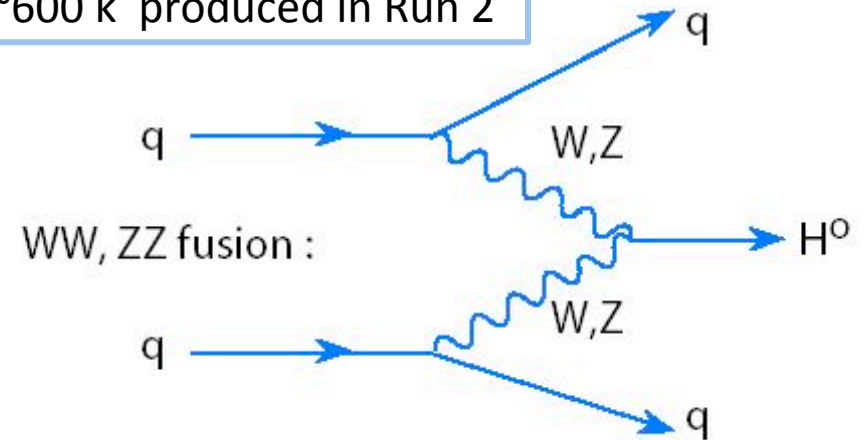

Higgs production modes

~8 M produced in Run 2

~40k produced in Run 2

~600 k produced in Run 2

~400 k produced in Run 2

Higgs decay modes

ZZ^* , $\gamma\gamma$

high mass resolution
→ mass and precise
differential
measurements

WW^*

high BR, low
mass resolution

$\mu\mu$

very small BR
access coupling to 2nd
generation fermions

bb , $\tau\tau$

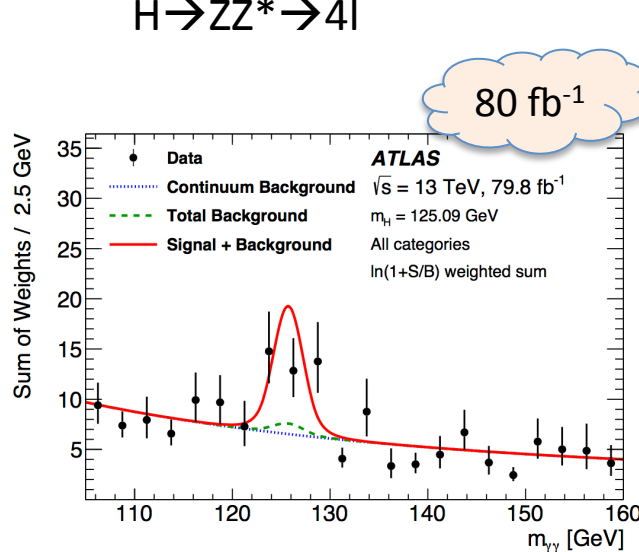

high BR, low S/B,
→ important as direct
probe of Higgs coupling
to fermions

measurement of $t\bar{t}H$ production

$H \rightarrow \gamma\gamma$

$H \rightarrow ZZ^* \rightarrow 4l$

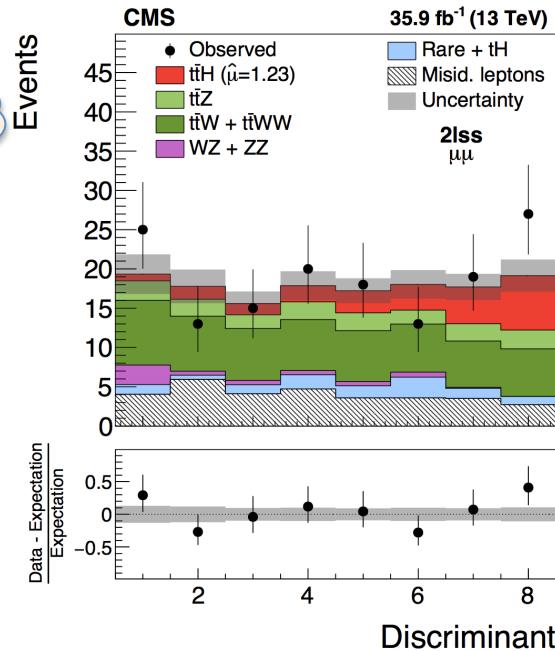

80 fb⁻¹

ATLAS 4.1 σ (3.7 σ exp.)

[Phys. Lett. B 784 \(2018\) 173](#)

$H \rightarrow WW^* \rightarrow l\nu l\nu; H \rightarrow \tau\tau$

CMS 3.2 σ (2.8 σ exp.)

[\[JHEP 08 \(2018\) 066\]](#)

$H \rightarrow b\bar{b}$

CMS 1.6 σ (2.2 σ exp.)

[\[arxiv 1804.03682\]](#)

[subm. JHEP]

Combination of ttH measurements

CMS 5.2 σ (4.2 σ exp.)

[Phys. Lett. B 779 \(2017\) 283](#)

[Phys. Lett. B 780 \(2017\) 501](#)

ATLAS 6.5 σ (5.3 σ exp.)

Direct observation of top Higgs coupling.
Confirmation of Yukawa coupling to fermions

Associated VH production and $H \rightarrow b\bar{b}$

$H \rightarrow b\bar{b}$ highest branching ratio: $\text{Br}=58\%$

Associated WH or ZH production (VH)

- $\text{Br}(H \rightarrow b\bar{b})$ constrains invisible Higgs decays
- Tests Higgs Yukawa coupling to fermions

Analysis with large background:

- Use high- p_T boson region
- Multi-variate analysis in 0, 1 and 2 lepton channels

ATLAS 5.4 σ (5.5 σ exp.)

Example: One input to di-jet mass analysis
 global fit – 1 lepton channel

[ATLAS-CONF-2018-036](#)

Dijet mass analysis as
 cross-check

Higgs couplings & decays

[ATLAS-CONF-2018-031](#)

[CMS-PAS-HIG-17-031](#)

ratio of couplings

mass dependence of couplings

- All couplings to high mass particles measured.
- Next challenge, second generation: muon, c-quark...

$H \rightarrow \mu\mu$ getting close to SM

[CMS-HIG-17-019 \(Acc. Phys.Rev.Lett.\)](#)

CMS (36 fb^{-1}) : $\mu_{\mu\mu} = 0.7 \pm 1.0$
 $\mu_{\mu\mu} < 2.6$ (2.1 exp.)

[ATLAS-CONF-2018-026](#)

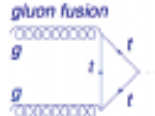

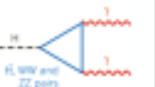

ATLAS (80 fb^{-1}) ; $\mu_{\mu\mu} = 0.1 + 1.0 - 1.1$
 $\mu_{\mu\mu} < 2.1$ (2.0 exp.)

Getting close to 10 x SM rate for Di-Higgs production
 Should reach SM sensitivity by the end of HL-LHC

Higgs mass

- **Run 1** Combination ATLAS + CMS:

[Phys.Rev.Lett. 114 \(2015\) 191803](#)

$$m_H = 125.09 \pm 0.24 \text{ GeV (0.19\%)}$$

- **Run 2**

ATLAS 36 fb⁻¹ $H \rightarrow \gamma\gamma, ZZ^* \rightarrow 4l$

[Phys. Lett. B 784 \(2018\) 345](#)

$$m_H = 124.86 \pm 0.27 \text{ GeV (0.21\%)} \text{ (stat. limited)}$$

CMS 36 fb⁻¹ $H \rightarrow ZZ^* \rightarrow 4l$

[JHEP 11 \(2017\) 047](#)

$$m_H = 125.26 \pm 0.21 \text{ GeV (0.17\%)} \text{ (stat. limited)}$$

Will improve with full Run 2

Higgs width

SM Higgs boson width: 4 MeV

→ too small for a precise direct measurement

- best direct limit CMS $H \rightarrow ZZ^* \rightarrow 4l$

[JHEP 1711 \(2017\) 047](#)

$\Gamma_H < 1.10 \text{ GeV @ 95\% CL}$

- ratio of on-shell to off-shell cross section

[Phys.Lett. B786 \(2018\) 223](#)

recent ATLAS measurement $H \rightarrow ZZ^* \rightarrow 4l, 2l2\nu$ 13 TeV 36 fb⁻¹

$\Gamma_H < 14.4 \text{ MeV (15.2 MeV exp.)}$

(NLO K_g, K_Z factor with some assumptions $K_{\text{on-shell}} = K_{\text{off-shell}}$)

x2 better than ATLAS, CMS Run 1 results

further improvements expected with full Run 2

Differential cross-section with gauge bosons decays

[ATLAS-CONF-2018-028](#)

Data well described by recent SM predictions.

Precision SM measurements

- Standard Model widely studied but need to
 - probe in so far inaccessible regions
 - High energy, rare processes
 - Difficult modeling: high-order/EW corrections
 - tune MC generators, constrain PDFs,
- Run 2 data = opportunity to look for BSM
 - Rare production processes
 - Processes sensitive to anomalous couplings
- Measure backgrounds for Higgs measurements and direct BSM searches

ICHEP2018 overview

[EW/SM/Top summary L. Skinnari](#)

Standard Model Production Cross Section Measurements

Status: July 2018

Electroweak measurements

- $W/Z/\gamma$ high-statistics samples
extract SM parameters & test self-consistency:
 - W boson mass
 - Weak mixing angle
- Multi-bosons
sensitive probe of BSM gauge interactions:
 - cross-section measurements
 - probe anomalous triple/quartic gauge couplings:
aTGC, QGC
 - vector boson scattering (VBS)

W boson mass

Key test of SM consistency

- Extract m_W using fits to lepton p_T & transverse mass
- Requires precise lepton energy/ momentum calibration
- about 12 MeV systematic uncertainty from W boson kinematic (PDF)
new LHC low pile-up data sample recently recorded

[Eur. Phys. J. C 78 \(2018\) 110](#)

$$m_W = 80370 \pm 19 \text{ MeV}$$

± 7 (stat) ± 11 (exp. syst) ± 14 (mod. syst) MeV

Top quark mass

Consistency of SM

W-mass: 80370 ± 19 MeV $\sim 0.02\%$ [Eur. Phys. J. C 78 \(2018\) 110](#)

Higgs mass: 124970 ± 240 MeV $\sim 0.2\%$ [Phys. Lett. B 784 \(2018\) 345](#)

Top-mass: 172510 ± 500 MeV $\sim 0.3\%$ [ATLAS-CONF-2017-071](#)

(will improve with Run 2)

similar results by CMS

Weak-mixing angle

Drell-Yan cross section $q\bar{q} \rightarrow Z \rightarrow \ell\bar{\ell}$: **spin correlation** between the initial-state spin-1/2 partons and the final-state spin-1/2 leptons mediated by a spin-1 intermediate state (mostly Z). In LO QCD:

$$\frac{d\sigma}{dy^{\ell\ell} dm^{\ell\ell} d\cos\theta} = \frac{3}{16\pi} \frac{d\sigma^{U+L}}{dy^{\ell\ell} dm^{\ell\ell}} \left\{ (1 + \cos^2\theta) + A_4 \cos\theta \right\}. \quad \text{ATLAS-CONF-2018-037}$$

8 TeV data: A_4 measured
 - two leptons $|\eta| < 2.4$ (cc)
 - at least one forward electron
 $2.5 < |\eta| < 4.6$ (cf).

$$\sin^2 \theta_{eff}^l = 0.23140 \pm 0.00036$$

Uncertainty break-down:

$$0.00021(stat) \pm 0.00024(PDF) \pm 0.00036$$

Main limitation PDF knowledge
 initial quark direction.

ATLAS Preliminary

global EW fit 0.23149 ± 0.00007

Vector Boson Scattering: same-sign WWjj

- **Key test of EWSB**
restoration of unitarity of the WW scattering cross-section
- **Sensitive to anomalous QGC**
- **Enhanced in BSM** scenarios (e.g. modified Higgs sector or new resonances)

1st observation CMS 2017

[Phys.Rev.Lett.120\(2018\)081801](https://arxiv.org/abs/1712.03521)

observation ATLAS 2018

[ATLAS-CONF-2018-030/](https://arxiv.org/abs/1808.07447)

ATLAS WZ 5.6 σ obs. (3.3 σ exp.)

CMS WZ 1.9 σ obs. (2.7 σ exp.) ZZ 2.7 σ obs. (1.6 σ exp.)

$t\bar{t}$ differential cross-section

[arXiv:1811.06625 subm. JHEP](https://arxiv.org/abs/1811.06625)

- large effort in measuring **multi-differential cross-sections**
- Overall good modeling of $t\bar{t}$ production provided by **NLO generators** but tend to produce p_T top spectra harder than the measured one
- Signal modeling among the largest systematic uncertainties
- new era of **NNLO calculations & EW corrections**: mis-modeling in top p_T spectrum improved, but not solved

$t\bar{t} + b\bar{b}$ differential cross-section

[CERN-EP-2018-276](#)

- Modeling of $t\bar{t}$ +HF essential for $t\bar{t}H$, $H \rightarrow b\bar{b}$ measurements (dominant uncertainty!)
- Challenging for QCD calculations due to massive b 's
- Some discrepancies observed -valuable input for MC tuning
- Dominant uncertainties from b-tagging & signal modeling

top spin correlation

Correlation of spin for $pp \rightarrow t\bar{t} \rightarrow e\mu b\bar{b}$
measured between the top decay
products and a spin axis with a
sensitive variable $\Delta\Phi(e\mu)$

Stronger spin correlations observed
than expected by NLO QCD.

Fit result: $f=1.250 \pm 0.026 \pm 0.063$
 3.2σ discrepancy with NLO QCD

But impact of NNLO calculations ?
Rene Poncelet et al.

[TOP2018 Rene Poncelet NNLO QCD top quark production & decay](#)

[ATLAS-CONF-2018-027](#)

4 tops production

- $\sigma_{ttt,SM} \approx 10^{-5} \times \sigma_{tt,SM}$ @ 13 TeV
- **Sensitive to new physics** (e.g. high mass scalars, top Yukawa coupling)

LHCb angle γ

[LHCb-CONF-2018-002](#)

[HFLAV Moriond2018](#)

- B_s^0 decays
- B^0 decays
- B^+ decays
- Combination

- Combination of 16 measurements from LHCb
- 98 observables with 40 free parameters
- some tension between different decay modes

Lepton Flavor Universality

Differences in ratios of decays in leptons should originate only in different masses
Clean probe for NP

$b \rightarrow c$ semileptonic decays

$$R_{D^*} = \frac{BR(B^0 \rightarrow D^{*+} \tau^- \bar{\nu})}{BR(B^0 \rightarrow D^{*+} \mu^- \bar{\nu})} \quad (R_D)$$

also

$$R_{J/\psi} = \frac{BR(B_c^+ \rightarrow J/\psi \tau^- \bar{\nu})}{BR(B_c^+ \rightarrow J/\psi \mu^- \bar{\nu})}$$

and

R_{D^*} with hadronic τ decays

$b \rightarrow s \ell \ell$ decays

$$R_{K^*} = \frac{BR(B^0 \rightarrow K^{*0} \mu^+ \mu^-)}{BR(B^0 \rightarrow K^{*0} e^+ e^-)} \quad (R_K)$$

also

anomalies in angular distributions
of $B \rightarrow K^{(*)} \mu^+ \mu^-$

Lepton Flavor Universality $b \rightarrow s \ell \ell$ decays

R_{K^*}

R_{K^*} consistent, but lower than the SM:

- 2.1-2.3 σ (low q^2)
- 2.4-2.5 σ (central q^2)

- LHCb JHEP 02 (2016)104
- Belle PRL 118 (2017)111801
- ATLAS-CONF-2017-023
- CMS-PAS-BPH-15-008

Lepton Flavor Universality R_D, R_{D^*}

Signal separated in ML fit with 3D templates in kinematic variables:

- missing mass: $m_{\text{miss}}^2 = (P_B - P_{D^*} - P_\mu)^2$
- muon energy

[HFLAV summer 2018](#)

All measurements above SM prediction

- R_{D^*} exceeds SM by 3.4σ
- R_D by 2.3σ
- Combination: close to 4σ

B anomalies - future

measurements still statistically limited and not always experimentally or theoretically “clean”

BUT

- Factor 3 of statistics of LHCb already on tape, being analysed
- Belle 2 starting to take data
- Run 3 new improved software trigger: much more similar between electron and muon
more channels, more cross-checks, etc.

Direct searches for new physics

- broad spectrum of models
 - new gauge bosons, new heavy fermions
 - Leptoquarks, vector-like quarks
 - SUSY
 - etc...
- broad spectrum of signatures
 - very heavy resonances
 - unconventional signatures (long-lived particles)
 - weakly interacting particles, large Missing ET, monojet searches

high energy events at LHC

1.5 TeV monojet

8 TeV dijet

Resonance search

In general 2-body final states, robust signal, many channels explored

[ATLAS-CONF-2018-017](#)

New **electro-weak gauge boson (W')**

(80 fb^{-1}) assuming SM coupling:

$M < 5.6 \text{ TeV}$ excluded at 95%CL

[CMS EXO-16-056](#)

String resonance (jj) $M < 8 \text{ TeV}$

Excited quark (jj) $< 6 \text{ TeV}$

increase of statistics, slow improvement

Dijet resonance search

Also covering low and intermediate range: lower trigger with reduced event info;
“ISR jet” trigger (for boosted jet with substructure)

ATLAS and CMS limits on g_q ($\sigma \propto g_q^4$)

[Dijet summary plots](#)

LeptoQuark

IFT Christmas Workshop

Exotics summary

- Many signatures and models are tested
- Expect moderate improvements for extremely high mass with higher statistics
- Several new approaches and analysis techniques target low/intermediate mass region and new signatures

SUSY

- Experiments have covered a huge set of scenarios and final states:
 - Strong production.
 - Electroweak production.
 - R-parity conserved and violated.
- Driven by simplified models.
 - Masses of non-relevant SUSY particles put very high.
 - 100% BR to single final state.used for model dependent exclusion limits.
- Produce large scans for pMSSM
 - MSSM (Minimal new particle content; No assumption on SUSY breaking)
 - 120 free parameters.
 - pMSSM (imposing phenomenological and experimental constraints)
 - 19 free parameters

SUSY cross-section

SUSY summary

- broad and diverse search program
 - Completing the program with 36 fb⁻¹ (2015+2016) dataset
 - first results with 80 fb⁻¹ dataset (2015+2016+2017)
- Simplified signatures covered to high masses
but plenty of low mass unexplored model space.
- the improvement in sensitivity will largely have to come from
 - the larger statistics
 - evolution of trigger and analysis techniquessince there will be no significant energy increase at the LHC anymore
- larger statistics will be most beneficial in case of electroweak processes, compressed scenarios, R-parity violating scenarios, etc.

[SUSY summary S. Strandberg](#)

LHC in the future

Credit Shahram Rahatlou CMS & LHCb Highlights ICHEP2018

Conclusion

- The LHC has worked fantastically
- The experiments took data with very high efficiency and detectors are well understood
- High precision measurements are possible at the LHC, even with high pile-up conditions
- Many measurements are still statistically limited and the full Run 2 data will bring them to an interesting level of precision
- New analysis techniques will also bring improvements
- We need increasingly precise theoretical predictions to keep up with the experimental precision
- Many estimates of future sensitivity are being prepared in the context of the European strategy process, based on our current better understanding of the performances

Stay tuned ...
