WHAT I WILL NOT TALK ABOUT

Scalar primordial non-Gaussianities

in multifield inflation

[Fumagalli *et al.*, LP 2019]

Phys. Rev. Lett. 123, 201302

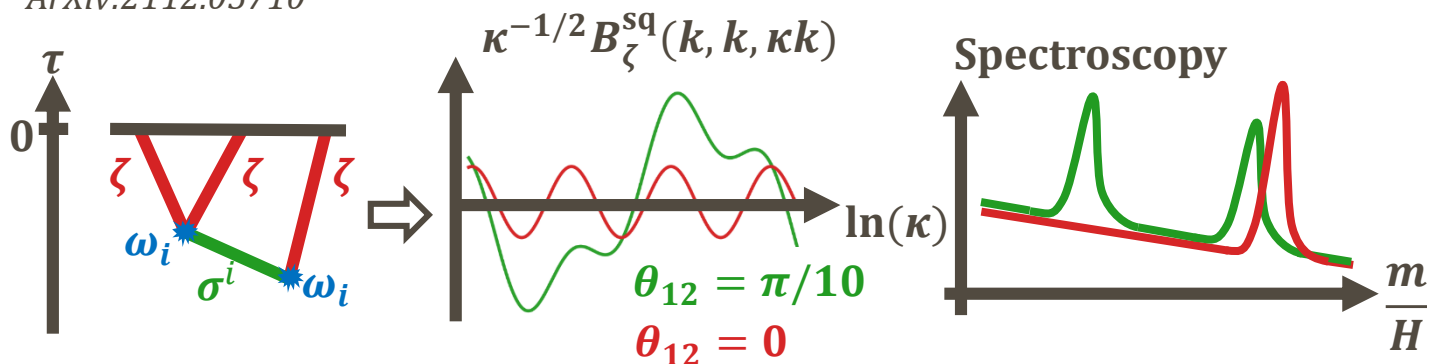

A multifield instability
in curved field space

$$f_{\text{NL}}^{\text{flat}} = \mathcal{O}(50)$$

$$g_{\text{NL}}^{\text{flat}} = \mathcal{O}(10^5) \text{ etc.}$$

[LP, Aoki, Renaux-Petel, Yamaguchi 2021]

ArXiv:2112.05710

Cubic action for perturbations in
multifield inflation with non-derivative
interactions

- $N_{\text{field}} = 2$

[Garcia-Saenz, LP, Renaux-Petel 2020]

J. High Energ. Phys. 2020, 73 (2020)

$$f_{\text{nl}}^{\text{eq}} \simeq \left(\frac{1}{c_s^2} - 1 \right) \left(-\frac{85}{324} + \frac{15}{243} A \right)$$

- N_{field} generic

[LP 2020]

J. Cosm. & Astro. Phys. 04(2021)048

$$A = -\frac{1}{2}(1 + c_s^2) + \frac{4}{3}(1 + 2c_s^2)\epsilon H^2 M_p^2 (m^{-2})_{11} R_{m\sigma m\sigma}$$

$$- \frac{\kappa}{6}(1 - c_s^2) (m^{-2})_{11} \left[V_{;mmm} + 2\epsilon H^2 M_p^2 R_{m\sigma m\sigma; m} \right.$$

$$\left. + 4\sqrt{2\epsilon} H M_p \left(\Omega_m^\alpha + \frac{1}{(m^{-2})_{11}} \frac{d(m^{-2})_{11}}{dt} \right) R_{m\alpha m\sigma} \right],$$

Important remark: can you see $f_{\text{NL}}^{\text{loc}}$ in this slide? → need to look for more theoretically motivated templates!

WHAT I WILL NOT TALK ABOUT

Scalar primordial non-Gaussianities

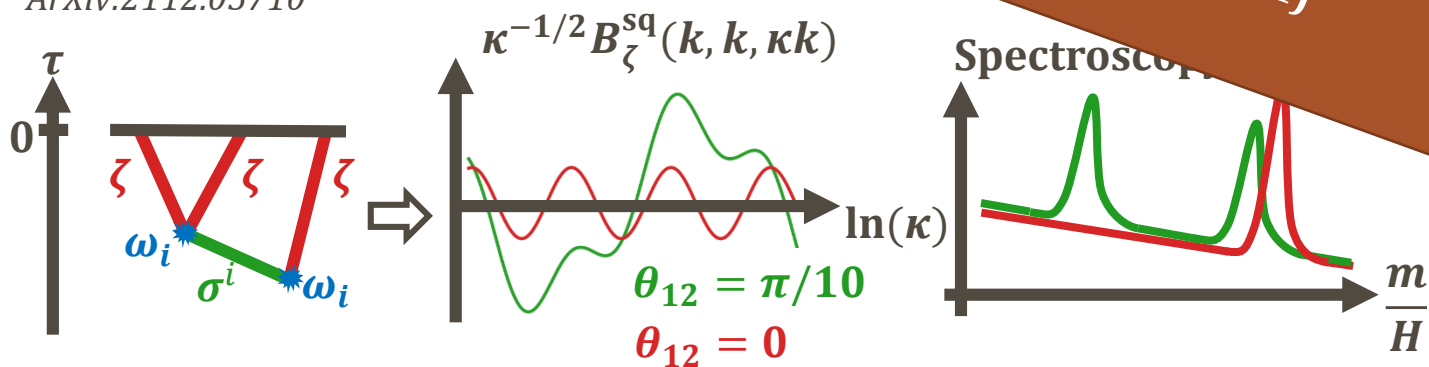

in multifield inflation

[Fumagalli et al. 2019]
Phys. Rev. Lett. 123, 081301 (2019)

A multifield instability
in curved field space

Multifield inflation DOES NOT IMPLY $f_{NL}^{loc} \gg 1$
(not even $f_{NL}^{loc} > 1$)

[LP, Aoki, Renaux-Petel, Yamaguchi 2021]
ArXiv:2112.05710

Cubic action for perturbations in multifield inflation with non-derivative interactions

- $N_{\text{field}} = 2$

[Garcia-Saenz, LP, Renaux-Petel 2020]

J. High Energ. Phys. 2020, 73 (2020)

$$f_{\text{nl}}^{\text{eq}} \simeq \left(\frac{1}{c_s^2} - 1 \right) \left(-\frac{85}{324} + \frac{15}{243} A \right)$$

N_{field} generic

Important remark: can you see f_{NL}^{loc} in this slide? → need to look for more theoretically motivated templates!

OTHER KINDS OF PNG

- Higher-order correlation functions:

$$\text{SSSS} \quad \left\langle \zeta_{\vec{k}_1} \zeta_{\vec{k}_2} \zeta_{\vec{k}_3} \zeta_{\vec{k}_4} \right\rangle = (2\pi)^3 \delta^{(3)}(\vec{k}_1 + \vec{k}_2 + \vec{k}_3 + \vec{k}_4) \times T_\zeta(\vec{k}_1, \vec{k}_2, \vec{k}_3, \vec{k}_4)$$

Trispectrum

etc.

- Tensor and mixed scalar-tensor PNG

$$\text{SST} \quad \left\langle \zeta_{\vec{k}_1} \zeta_{\vec{k}_2} \gamma_{\vec{k}_3} \right\rangle = (2\pi)^3 \delta^{(3)}(\vec{k}_1 + \vec{k}_2 + \vec{k}_3) \times B_{\zeta\zeta\gamma}(k_1, k_2, k_3)$$

$$\text{STT} \quad \left\langle \zeta_{\vec{k}_1} \gamma_{\vec{k}_2} \gamma_{\vec{k}_3} \right\rangle = (2\pi)^3 \delta^{(3)}(\vec{k}_1 + \vec{k}_2 + \vec{k}_3) \times B_{\zeta\gamma\gamma}(k_1, k_2, k_3)$$

$$\text{TTT} \quad \left\langle \gamma_{\vec{k}_1} \gamma_{\vec{k}_2} \gamma_{\vec{k}_3} \right\rangle = (2\pi)^3 \delta^{(3)}(\vec{k}_1 + \vec{k}_2 + \vec{k}_3) \times B_{\gamma\gamma\gamma}(k_1, k_2, k_3)$$

All these correlators are observable and contain information about high-energy physics and inflation

OTHER KINDS OF PNG: CONSTRAINTS

Bounds at CMB scales

- Higher-order correlation functions:

$$\text{SSSS} \xrightarrow{\text{squeezed}} g_{\text{NL}} = (-5.8 \pm 6.5)10^4 \text{ [Planck 2018]}$$

$$\text{SSSS} \xrightarrow{\text{collapsed}} \tau_{\text{NL}} = ???$$

$$\tau_{\text{NL}} \geq \left(\frac{6}{5} f_{\text{NL}}^{\text{loc}}\right)^2 \text{ with equality in single-field only}$$

from theory...

- Tensor and mixed scalar-tensor PNG

$$\text{SST} \xrightarrow{\text{squeezed}} f_{\text{NL,loc}}^{\zeta\zeta\gamma} = -48 \pm 28 \text{ [Shiraishi, Liguori, Fergusson 2017]}$$

$$\text{STT} \xrightarrow{\text{squeezed}} f_{\text{NL,loc}}^{\zeta\gamma\gamma} = ???$$

$$\text{TTT} \xrightarrow{\text{squeezed}} f_{\text{NL,loc}}^{\gamma\gamma\gamma} = 220 \pm 170 \text{ [WMAP 2013]}$$

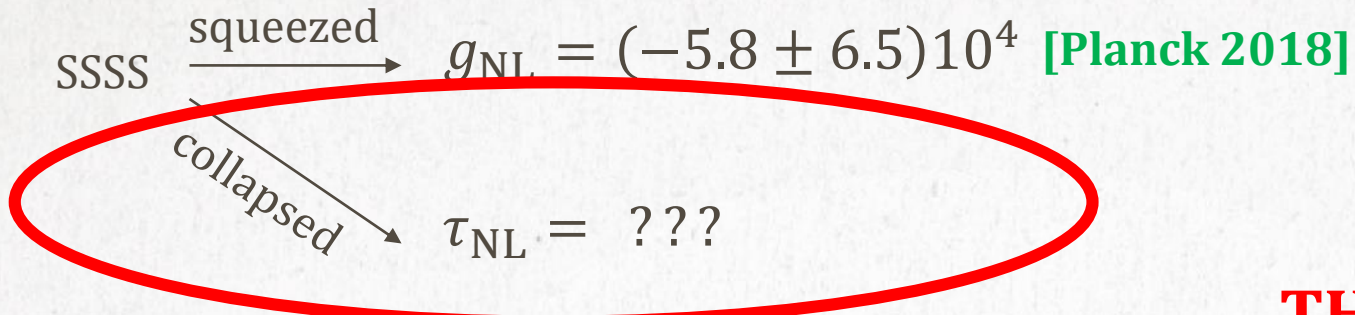

[Suyama, Yamaguchi 2007]
[Smith, LoVerde, Zaldarriaga 2011]

... and nothing else...

Please tell me if these are outdated

OTHER KINDS OF PNG: CONSTRAINTS

- Higher-order correlation functions:

- Tensor and mixed scalar-tensor PNG

THIS TALK

SST $\xrightarrow{\text{squeezed}}$ $f_{\text{NL,loc}}^{\zeta\zeta\gamma} = -48 \pm 28$ [Shiraishi, Liguori, Fergusson 2017]

STT $\xrightarrow{\text{squeezed}}$ $f_{\text{NL,loc}}^{\zeta\gamma\gamma} = ???$

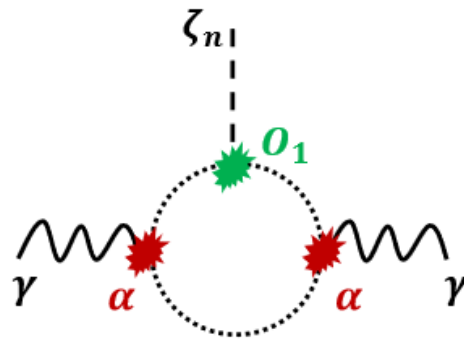

TTT $\xrightarrow{\text{squeezed}}$ $f_{\text{NL,loc}}^{\gamma\gamma\gamma} = 220 \pm 170$ [WMAP 2013]

I. STT and TTT squeezed PNG: Induced anisotropies in the SGWB

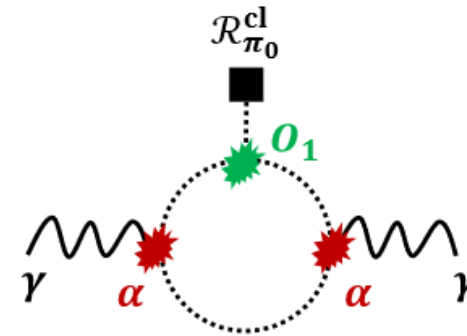

*Stochastic Gravitational
Wave Background*

(a) One-loop tensor power spectrum

(b) One-loop scalar-tensor-tensor bispectrum

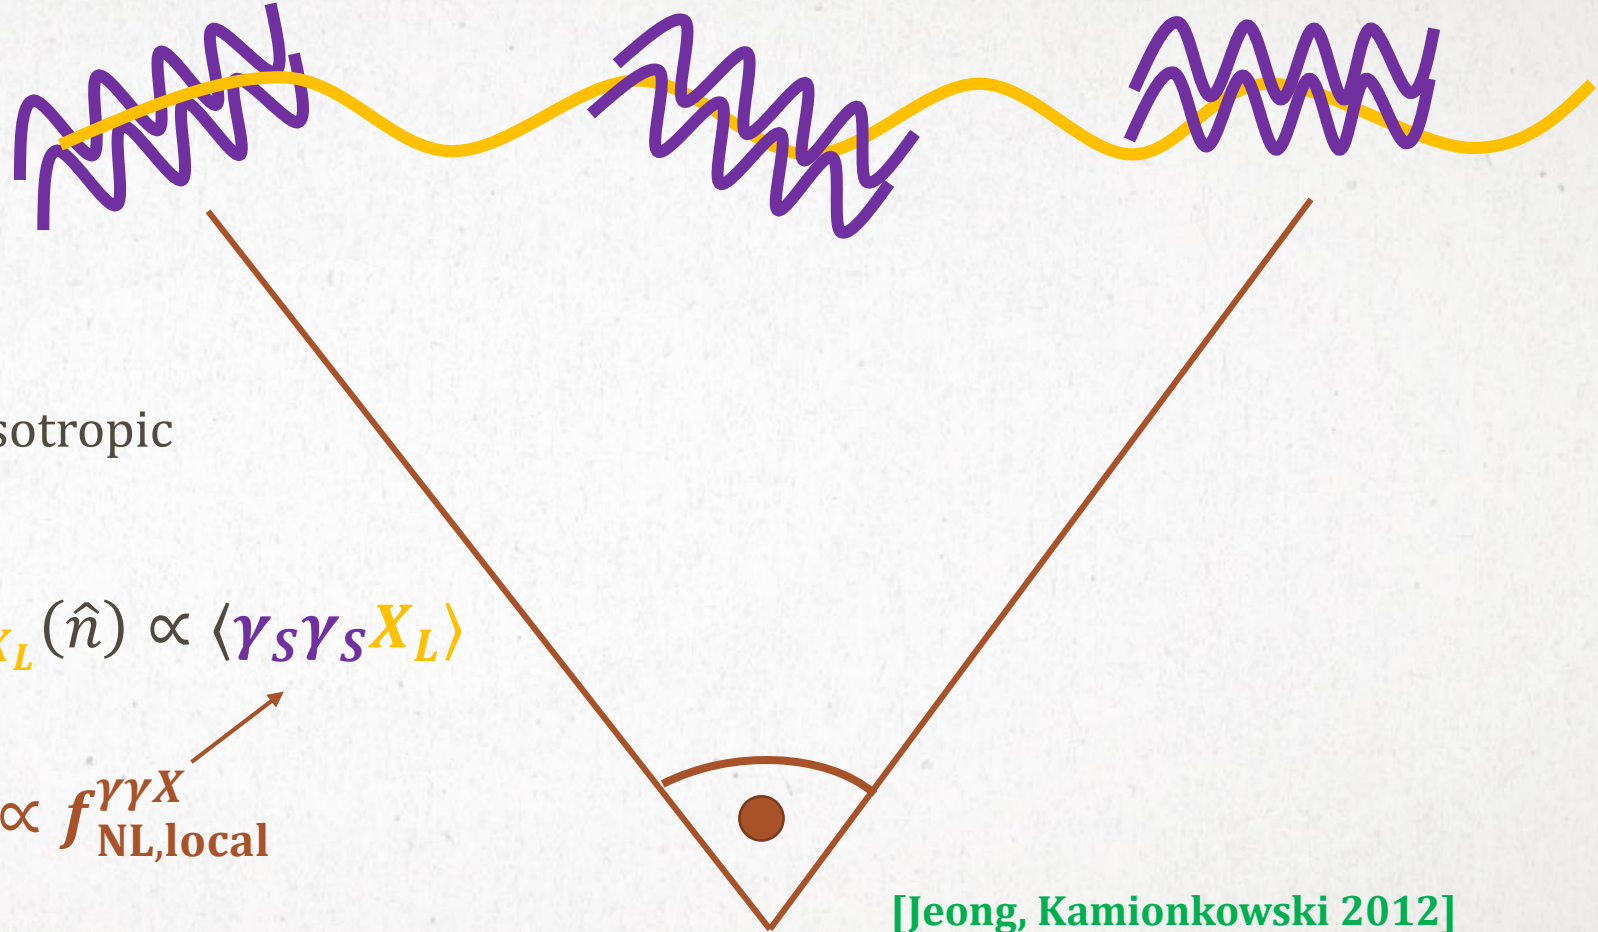

(c) One-loop tensor two-point function in the presence of a classical scalar source.

PNG-INDUCED ANISOTROPIES IN THE SGWB

- The idea:

Consider the modulation of **two short modes** by a **long one**:
seen from far away the signal is anisotropic

$$\langle \gamma_s \gamma_s \rangle \rightarrow \delta_{\text{GW}}(\hat{n}, f_s) \propto \langle \gamma_s \gamma_s \rangle_{X_L}(\hat{n}) \propto \langle \gamma_s \gamma_s X_L \rangle$$

$$\frac{\Omega_{\text{GW}}(\hat{n}, f)}{\bar{\Omega}_{\text{GW}}(f)} - 1$$

$$\propto f_{\text{NL,local}}^{\gamma\gamma X}$$

[Jeong, Kamionkowski 2012]

Here γ_s is a tensor (anisotropies of the SGWB) but first introduced for scalars (anisotropies of LSS)

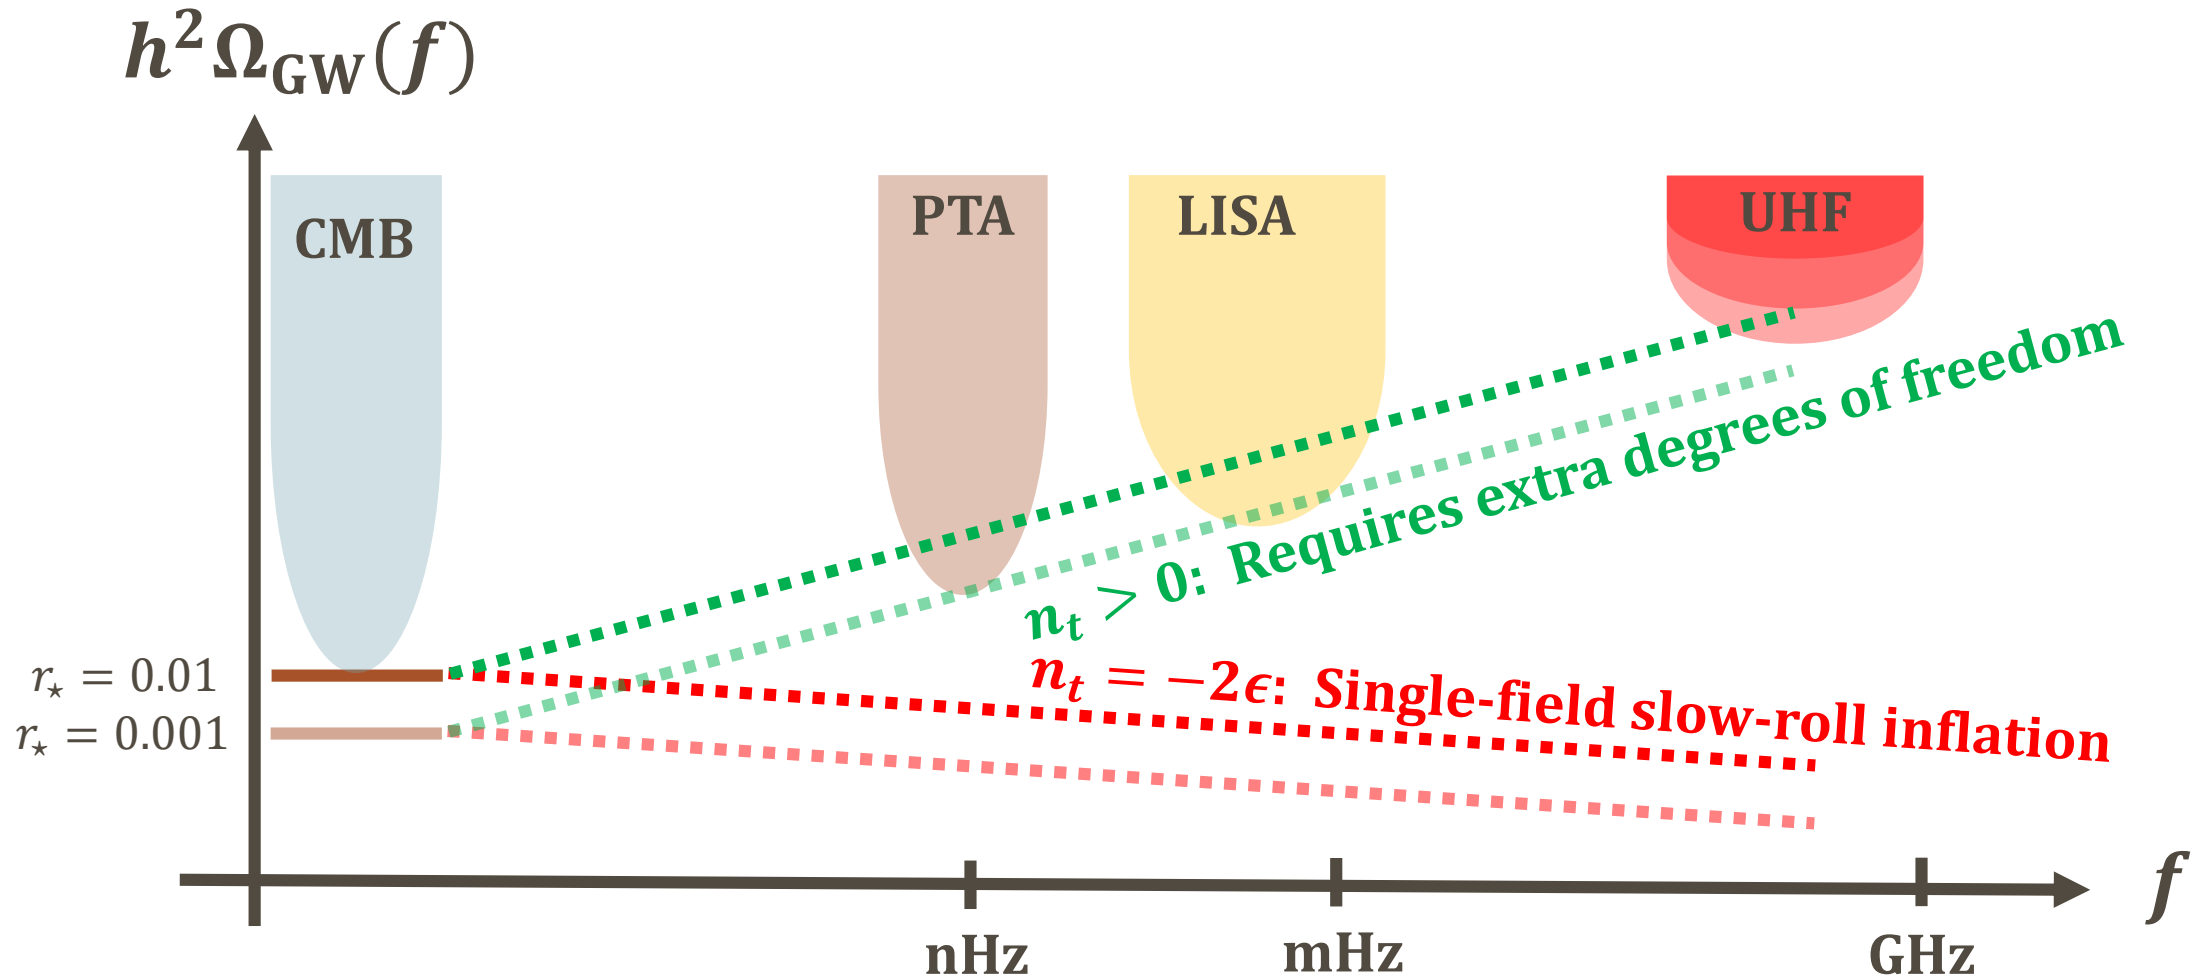

Also X_L can be ζ_L (modulation by a soft scalar mode) or γ_L (modulation by a soft tensor mode)

INGREDIENTS FOR OBSERVABLE GW ANISOTROPIES

- Having an observable monopole signal

INGREDIENTS FOR OBSERVABLE GW ANISOTROPIES

- Having an observable monopole signal → smaller scales, requires a blue tilt: $n_t > 0$

INGREDIENTS FOR OBSERVABLE GW ANISOTROPIES

- Having an observable monopole signal: $n_t > 0$
- Having large STT or TTT bispectra in the (ultra) squeezed limit

INGREDIENTS FOR OBSERVABLE GW ANISOTROPIES

➤ Having an observable monopole signal: $n_t > 0$

➤ Having large STT or TTT bispectra in the (ultra) squeezed limit: $f_{\text{NL,sq}}^{\zeta\gamma\gamma}, f_{\text{NL,sq}}^{\gamma\gamma\gamma} \gg 1$

$$\left\langle \gamma_{\vec{k}_1}^{\lambda_1} \gamma_{\vec{k}_2}^{\lambda_2} \right\rangle_{\gamma_{\vec{q}_L}} = \sum_{\lambda_3} \int_{|\vec{q}| < q_L} d^3 q \delta^{(3)}(\mathbf{k}_1 + \mathbf{k}_2 + \mathbf{q}) \gamma_{\mathbf{q}}^{*\lambda_3} \frac{B_{\gamma}^{\lambda_1 \lambda_2 \lambda_3}(\mathbf{k}_1, \mathbf{k}_2, \mathbf{q})}{P_{\gamma}^{\lambda_3}(q)}$$

“heuristic” formula of the literature

[Ricciardone, Tasinato 2017]

[Dimastrogiovanni, Fasiello, Tasinato 2019]

INGREDIENTS FOR OBSERVABLE GW ANISOTROPIES

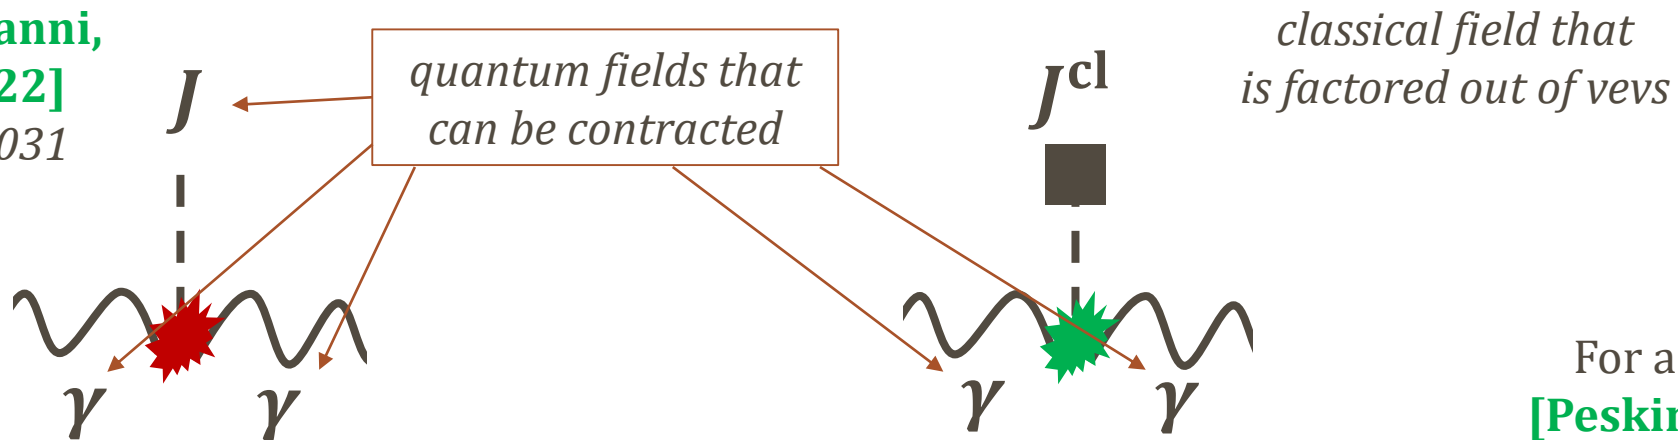

- Having an observable monopole signal: $n_t > 0$
- Having large STT or TTT bispectra in the (ultra) squeezed limit: $f_{\text{NL,sq}}^{\zeta\gamma\gamma}, f_{\text{NL,sq}}^{\gamma\gamma\gamma} \gg 1$
- That this squeezed limit is not due to spurious gauge artifacts (consistency relation discussed yesterday)

INGREDIENTS FOR OBSERVABLE GW ANISOTROPIES

- Having an observable monopole signal: $n_t > 0$
- Having large STT or TTT bispectra in the (ultra) squeezed limit: $f_{\text{NL,sq}}^{\zeta\gamma\gamma}, f_{\text{NL,sq}}^{\gamma\gamma\gamma} \gg 1$
- That this squeezed limit is not due to spurious gauge artifacts (consistency relation discussed yesterday)

This work: ❖ Go beyond the heuristic approach and **compute** the two-point function with a classical source

[Dimastrogiovanni,
Fasiello, LP 2022]
JCAP 09 (2022) 031

For a QED example see
[Peskin, Schroeder 1995]

INGREDIENTS FOR OBSERVABLE GW ANISOTROPIES

- Having an observable monopole signal: $n_t > 0$
- Having large STT or TTT bispectra in the (ultra) squeezed limit: $f_{\text{NL,sq}}^{\zeta\gamma\gamma}, f_{\text{NL,sq}}^{\gamma\gamma\gamma} \gg 1$
- That this squeezed limit is not due to spurious gauge artifacts (consistency relation discussed yesterday)

[Dimastrogiovanni,
Fasiello, LP 2022]

JCAP 09 (2022) 031

This work: ❖ Go beyond the heuristic approach and **compute** the two-point function with a classical source

$$\langle \gamma_{\vec{k}_1} \gamma_{\vec{k}_2} \rangle_{J^{\text{cl}}} \Big|_{|\vec{k}_1 + \vec{k}_2| \ll k_{1,2}} = \int d^3 \vec{q} \delta^{(3)}(\vec{q} + \vec{k}_1 + \vec{k}_2) P_\gamma(k_1) f_{\text{NL,sq}}^{J\gamma\gamma}(\vec{k}_1, \vec{k}_2, \vec{q}) J^{\text{cl}}(\vec{q})$$

Non-diagonal part, $\vec{k}_1 + \vec{k}_2 \neq \vec{0}$, of the 2-pt function does not vanish \rightarrow anisotropies

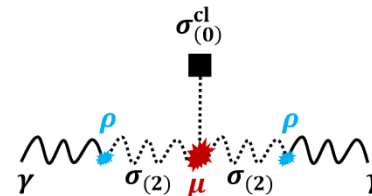

$J^{\text{cl}}(\vec{q})$ is a statistical quantity \rightarrow so is $\langle \gamma_{\vec{k}_1} \gamma_{\vec{k}_2} \rangle_{J^{\text{cl}}} \rightarrow \langle \delta(\hat{n}_1) \delta(\hat{n}_2) \rangle \propto \langle J^{\text{cl}}(\vec{q}) J^{\text{cl}}(\vec{q}') \rangle \neq 0$

INGREDIENTS FOR OBSERVABLE GW ANISOTROPIES

- Having an observable monopole signal: $n_t > 0$ 
 - Having large STT or TTT bispectra in the (ultra) squeezed limit: $f_{\text{NL,sq}}^{\zeta\gamma\gamma}, f_{\text{NL,sq}}^{\gamma\gamma\gamma} \gg 1$ 
 - That this **squeezed limit is not due to spurious gauge artifacts** ( consistency relation discussed yesterday)
- [Dimastrogiovanni, Fasiello, LP 2022]
JCAP 09 (2022) 031
- This work: ❖ Go beyond the heuristic approach and compute the two-point function with a classical source
- ❖ Prove that some already existing inflationary models verify **all 3 requirements above**

Example 1: EFT of spin-2 field
[Bordin et al. 2018]

$$\sigma_{ij} = \partial_i \partial_j \sigma^{(0)} + \sigma_{ij}^{(2)}$$

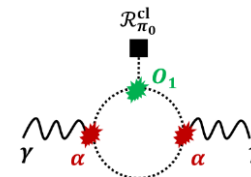

Example 2: Supersolid inflation
[Celoria et al. 2021]

Two scalars (ζ_n, R_{π_0})

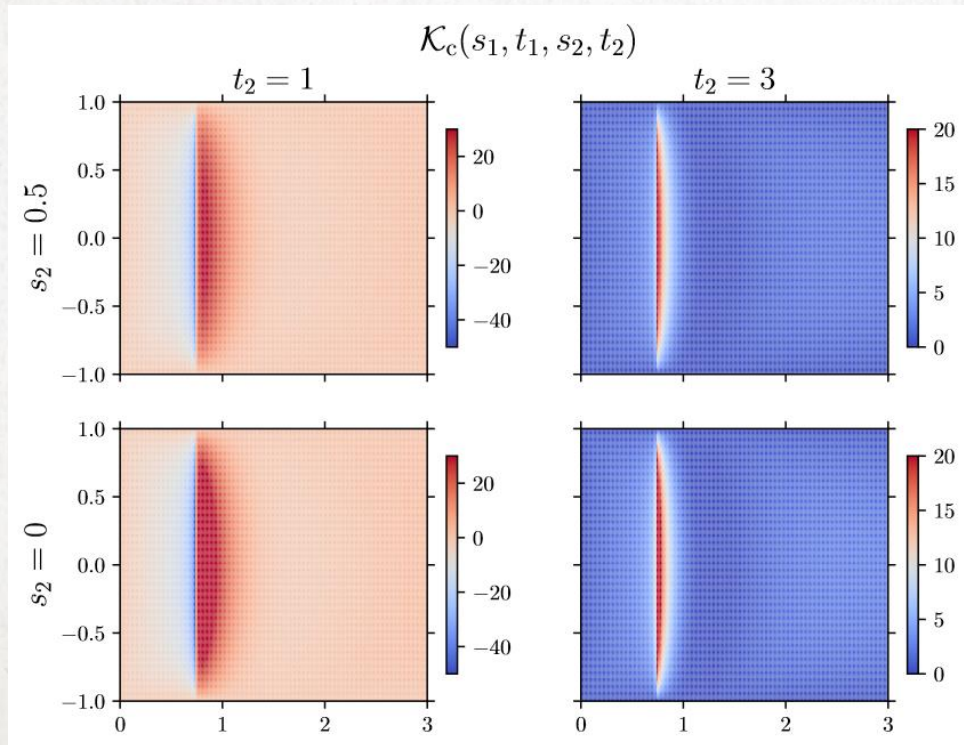

adiabatic

entropic

$$\delta_{\text{GW}}(\hat{n}) \geq 10\%$$

II. Scalar-trispectrum -induced gravitational waves

Kernel of integration over scalar trispectrum shapes

SCALAR-INDUCED GW

❖ At horizon re-entry in the radiation era:

$$\gamma_k'' + 2\mathcal{H}\gamma_k' + k^2\gamma_k = \mathcal{S}_k$$

Source term including scalar perturbations at quadratic order

$$\propto \int d^3\vec{q} (\dots) \zeta_{\vec{q}} \zeta_{\vec{k}-\vec{q}}$$

SCALAR-INDUCED GW

- ❖ At horizon re-entry in the radiation era:

$$\gamma_k'' + 2\mathcal{H}\gamma_k' + k^2\gamma_k = \mathcal{S}_k$$

Source term including scalar perturbations at quadratic order

$$\propto \int d^3\vec{q} (\dots) \zeta_{\vec{q}} \zeta_{\vec{k}-\vec{q}}$$

- ❖ The tensor two-point function is proportional to the scalar four-point function:

$$P_\gamma(k) = \int d^3\vec{q}_1 \int d^3\vec{q}_2 \mathcal{K}(\vec{q}_1, \vec{q}_2) \times \langle \zeta_{\vec{q}_1} \zeta_{\vec{k}-\vec{q}_1} \zeta_{-\vec{q}_2} \zeta_{-\vec{k}+\vec{q}_2} \rangle$$

general kernel

[Adshead, Lozanov, Weiner 2021]

[Garcia-Saenz, LP, Renaux-Petel, Werth 2022]

ArXiv: 2207.14267

we discuss its symmetries, etc.

SCALAR-INDUCED GW

❖ At horizon re-entry in the radiation era:

$$\gamma_k'' + 2\mathcal{H}\gamma_k' + k^2\gamma_k = \mathcal{S}_k$$

Source term including scalar perturbations at quadratic order

$$\propto \int d^3\vec{q} (\dots) \zeta_{\vec{q}} \zeta_{\vec{k}-\vec{q}}$$

❖ The tensor two-point function is proportional to the scalar four-point function:

$$P_\gamma(k) = \int d^3\vec{q}_1 \int d^3\vec{q}_2 \mathcal{K}(\vec{q}_1, \vec{q}_2) \times \langle \zeta_{\vec{q}_1} \zeta_{\vec{k}-\vec{q}_1} \zeta_{-\vec{q}_2} \zeta_{-\vec{k}+\vec{q}_2} \rangle$$

Disconnected (Gaussian) piece:

$$(2\pi)^3 \delta^{(3)}(\vec{q}_1 - \vec{q}_2) P_\zeta(q_1) P_\zeta(|\vec{k} - \vec{q}_1|)$$

+ perm.

[Many works]

Connected (non-Gaussian) piece:

$$T_\zeta(\vec{q}_1, \vec{k} - \vec{q}_1, -\vec{q}_2, -\vec{k} + \vec{q}_2)$$

[Garcia-Saenz, LP, Renaux-Petel, Werth 2022]

ArXiv: 2207.14267

SCALAR-TRISPECTRUM-INDUCED GW

❖ Only a few recent works working out *some* scalar trispectrum effects:

[Garcia-Bellido, Peloso, Unal 2017]
[Unal 2018]
[Atal, Domenech 2021]
[Adshead, Lozanov, Weiner 2021]

❖ But *all* limited themselves to **local non-linearities**: $\zeta = \zeta_G + f_{\text{NL}}^{\text{loc}} \zeta_G^2$

renormalizes the power spectrum: $P_\zeta = P_{\zeta_G} + 3f_{\text{NL}}^2 (P_{\zeta_G})^2$ induces NGs: $\langle \zeta^4 \rangle_{\text{connected}} \propto f_{\text{NL}}^2 P_{\zeta_G}^3 + \mathcal{O}(f_{\text{NL}}^3)$

... and did not check perturbative control → large effects from NGs

NO-GO THEOREM FOR SCALAR-TRISPECTRUM-INDUCED GW

Lemma. Given real symmetric matrices A and B , with A positive definite, then $C \equiv AB$ is diagonalizable (over the complex numbers) and has real eigenvalues.

This work:

[Garcia-Saenz, LP, Renaux-Petel, Werth 2022]

ArXiv:

2207.14267

Local shapes

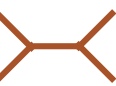

❖ we investigate motivated scalar trispectrum shapes

❖ AND we check perturbative control

—————→ **small loops:** 

“Equilateral” shapes:
interactions from EFTol

“Cosmo. collider” shapes:
exchange of massive and
spinning fields

Shape	$\Omega_{\text{connected}}^{\text{GW}} / \Omega_{\text{disconnected}}^{\text{GW}}$	Perturbativity bound
g_{NL}	0	...
τ_{NL}	$4 \times \tau_{\text{NL}} \mathcal{P}_\zeta \log(kL)$	$\tau_{\text{NL}} \mathcal{P}_\zeta \log(kL) \ll 1$
$t_{\text{NL}}^{\zeta^4}, t_{\text{NL}}^{\zeta^2(\partial\zeta)^2}, t_{\text{NL}}^{(\partial\zeta)^4}$	 0 or negligible	...
$t_{\text{NL}}^{[\zeta^3]^2}, t_{\text{NL}}^{[\zeta(\partial\zeta)^2]^2}, t_{\text{NL}}^{\zeta^3 \times \zeta(\partial\zeta)^2}$	 $\mathcal{O}(10^{-1}) \times (H/\Lambda_\star)^4$ Numerically computed coefficient	$H/\Lambda_\star \ll 1$
$\tau_{\text{NL}}^{\text{exchange}}(\Delta, S)$	 $4f(\Delta, S) \times \tau_{\text{NL}} \mathcal{P}_\zeta \log(kL)$?

L is the size of the Universe (IR cutoff)

Λ_\star is the smallest strong coupling scale

$f(\Delta, S) < 1$

CONCLUSION

- Primordial NGs contain much more information than a single number $f_{\text{NL}}^{\text{local}}$
- Depending on the mass spectrum and interactions of primordial field content, scalar and tensor PNGs are of different **amplitudes** and **shapes**
- Small-scale ultra-squeezed STT and TTT PNGs survive in the form of induced anisotropies in the SGWB
- The scalar trispectrum sources GWs at horizon re-entry but its relative contribution must remain small
IN SCALE-INVARIANT MODELS

↳ **Warning for scale-dependent models:
compute perturbativity bounds!**

**Formidable opportunity to use
the non-linear Universe as a
particle detector**

BACK UP SLIDES

ANISOTROPIES

SEVERAL SOURCES OF ANISOTROPIES

- GWs signal from astrophysical sources expected to be anisotropic
[Cusin *et al.* 2017, 2018, 2019]
[Bertacca *et al.* 2019]
[Bellomo *et al.* 2021]
- Cosmological background propagates through structures → anisotropic
[Alba, Maldacena 2015]
[Contaldi *et al.* 2016]
[Bartolo *et al.* 2018, 2019] *These anisotropies inherit a non-Gaussian statistics from propagation*
[Domcke, Jinno, Rubira 2020]
- Primordial NGs also induce anisotropies:
[Jeong, Kamionkowski 2012] *Anisotropies of the LSS from the same effect*
[Brahma, Nelson, Chandra 2013]
[Dimastrogiovanni *et al.* 2014, 2015, 2021]

PNG-INDUCED ANISOTROPIES

[Dimastrogiovanni, Fasiello, LP 2022]

ArXiv:2203.17192

- Formal derivations with the in-in formalism:

- ❖ We look for interactions between small and large scales $\rightarrow f_{\text{NL},\gamma\gamma\gamma}^{\text{sq}}$ and $f_{\text{NL},\gamma\gamma\zeta}^{\text{sq}}$

- ❖ A long-wavelength mode J_L can be treated classically and has negligible derivatives:

$$\hat{J}_L = J_L(\tau)\hat{a}_{\vec{k}} + J_L^*(\tau)\hat{a}_{-\vec{k}}^\dagger \rightarrow J_L^{\text{cl}}(\tau) \underbrace{(\hat{a}_{\vec{k}} + \hat{a}_{-\vec{k}}^\dagger)}_{\mathbf{b}_{\vec{k}}} \quad ; \quad (\partial_i J_L^{\text{cl}}, \partial_t J_L^{\text{cl}}) \text{ are negligible}$$

$$[\hat{a}_{\vec{k}}, \hat{a}_{\vec{k}'}^\dagger] = (2\pi)^3 \delta^{(3)}(\vec{k} - \vec{k}') \quad \mathbf{b}_{\vec{k}} \quad [b_{\vec{k}}, b_{\vec{k}'}^\dagger] = 0$$

Ex: massless scalar perturbation $Q_k(\tau) = \frac{e^{-ik\tau}}{\sqrt{2k^3}} (1 + ik\tau) \xrightarrow{-k\tau \rightarrow 0} \frac{1}{\sqrt{2k^3}}$ purely real

PNG-INDUCED ANISOTROPIES

[Dimastrogiovanni, Fasiello, LP 2022]

ArXiv:2203.17192

- Formal derivations with the in-in formalism:

- ❖ We look for interactions between small and large scales $\rightarrow f_{\text{NL},\gamma\gamma\gamma}^{\text{sq}}$ and $f_{\text{NL},\gamma\gamma\zeta}^{\text{sq}}$

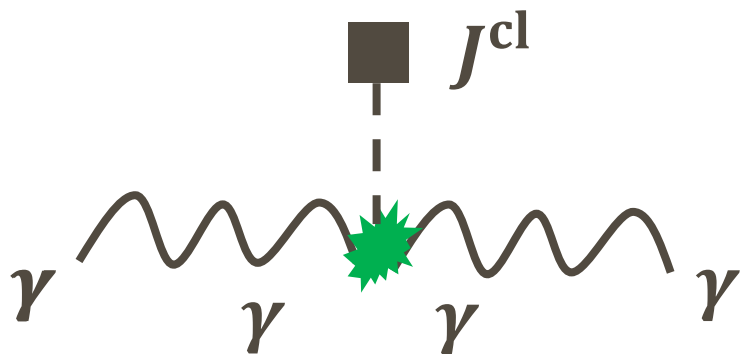

- ❖ A long-wavelength mode J_L can be treated classically and has negligible derivatives:

$$\hat{J}_L = J_L(\tau)\hat{a}_{\vec{k}} + J_L^*(\tau)\hat{a}_{-\vec{k}}^\dagger \rightarrow J_L^{\text{cl}}(\tau) \left(\hat{a}_{\vec{k}} + \hat{a}_{-\vec{k}}^\dagger \right) \quad ; \quad (\partial_i J_L^{\text{cl}}, \partial_t J_L^{\text{cl}}) \text{ are negligible}$$

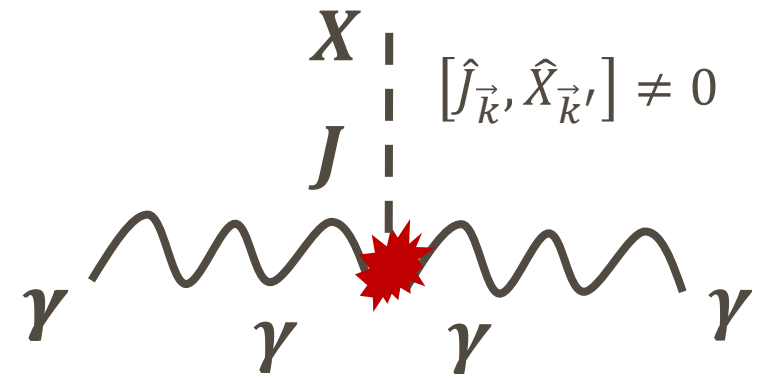

- ❖ A **3-pt interaction** involving J_L becomes a **2-pt interaction** times a classical source J_L^{cl}

- ❖ 2-pt functions in the presence of a classical source are now defined:

$$\langle \gamma_{\vec{k}_1} \gamma_{\vec{k}_2} \rangle_{J^{\text{cl}}}$$

$$\langle \gamma_{\vec{k}_1} \gamma_{\vec{k}_2} X_{\vec{k}_3} \rangle = (2\pi)^3 \delta^3(\vec{k}_1 + \vec{k}_2 + \vec{k}_3) B^{\gamma\gamma X}$$

PNG-INDUCED ANISOTROPIES

[Dimastrogiovanni, Fasiello, LP 2022]

ArXiv:2203.17192

- Formal derivations with the in-in formalism:

- ❖ We look for interactions between small and large scales $\rightarrow f_{\text{NL},\gamma\gamma\gamma}^{\text{sq}}$ and $f_{\text{NL},\gamma\gamma\zeta}^{\text{sq}}$

- ❖ A long-wavelength mode J_L can be treated classically and has negligible derivatives:

$$\hat{J}_L = J_L(\tau)\hat{a}_{\vec{k}} + J_L^*(\tau)\hat{a}_{-\vec{k}}^\dagger \rightarrow J_L^{\text{cl}}(\tau) \left(\hat{a}_{\vec{k}} + \hat{a}_{-\vec{k}}^\dagger \right) \quad ; \quad (\partial_i J_L^{\text{cl}}, \partial_t J_L^{\text{cl}}) \text{ are negligible}$$

- ❖ A **3-pt interaction** involving J_L becomes a **2-pt interaction** times a classical source J_L^{cl}

- ❖ 2-pt functions in the presence of a classical source are now defined

- ❖ We compute both diagrams with the in-in formalism and are therefore able to relate them:

$$\langle \gamma_{\vec{k}_1} \gamma_{\vec{k}_2} \rangle_{X^{\text{cl}}} \Big|_{|\vec{k}_1 + \vec{k}_2| \ll k_{1,2}} = \int d^3 \vec{q} \delta^{(3)}(\vec{q} + \vec{k}_1 + \vec{k}_2) P_\gamma(k_1) f_{\text{NL},\text{sq}}^{\gamma\gamma X}(\vec{k}_1, \vec{k}_2, \vec{q}) X^{\text{cl}}(\vec{q})$$

Derivation makes clear that the non-diagonal part of the 2-pt function does not vanish \rightarrow anisotropies

J can be X (the formula reduces then to the one in the literature), or not but you need $[\hat{J}, \hat{X}] \neq 0$

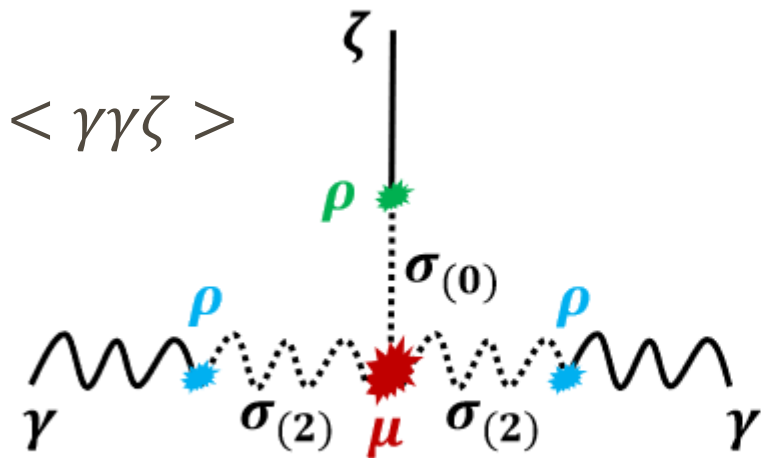

MULTIFIELD MODELS WITH LARGE ANISOTROPIES

- Spin-2 EFT of inflation: $\sigma_{ij} = \partial_i \partial_j \sigma^{(0)} + \sigma_{ij}^{(2)}$ [Bordin et al. 2018]

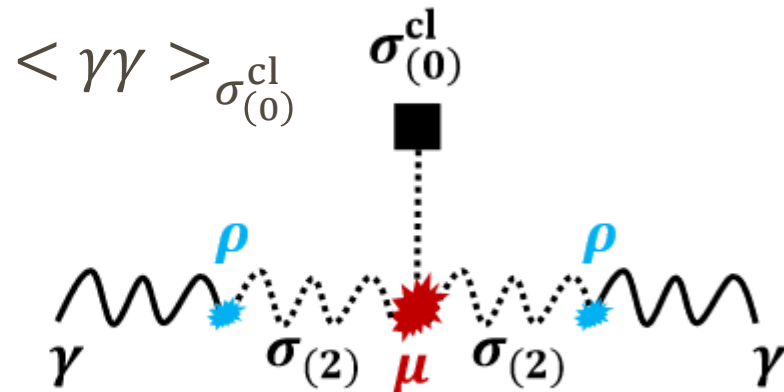

→ $\sigma^{(2)}$ couples linearly to γ and can enhance the tensor power spectrum: $A_t / \frac{2H^2}{M_{Pl}^2} \sim \frac{\rho^2}{c_2^3}$

make the tilt blue: $n_t \sim -3 \partial_t c_2 / (H c_2)$

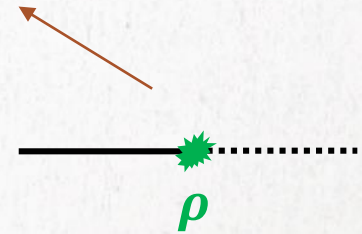

We compute anisotropies explicitly and find: $\sqrt{\langle \delta_{GW}^2(k_S, \hat{n}) \rangle} \sim \frac{\langle \gamma\gamma\zeta \rangle(k_S, k_S, k_L)}{P_\gamma(k_S) P_{\zeta\sigma^{(0)}}(k_L)} \sqrt{\mathcal{P}_{\sigma^{(0)}}(k_L)}$

(a) Mixed scalar-tensor-tensor bispectrum.

(b) Tensor two-point function in the presence of a classical scalar source.

[Dimastrogiovanni,
Fasiello, LP 2022]

ArXiv:2203.17192

MULTIFIELD MODELS WITH LARGE ANISOTROPIES

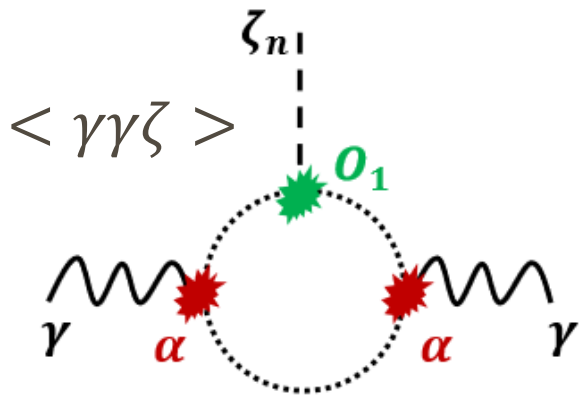

adiabatic entropic

- Supersolid inflation: two fundamental scalar fluctuations (ζ_n, R_{π_0}) [Celoria et al. 2021]

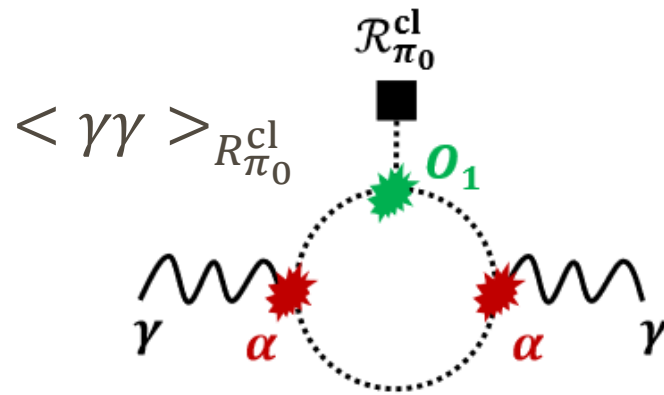

→ R_{π_0} couples **quadratically** to γ and can enhance the tensor power spectrum: $A_t / \frac{2H^2}{M_{Pl}^2} > 1$

make the tilt blue: $n_t = 2(n_s^{en} - 1) > 0$

We compute anisotropies explicitly and find: $\sqrt{\langle \delta_{GW}^2(k_S, \hat{n}) \rangle} \sim \underbrace{f_{NL,sq}^{\gamma\gamma\zeta_n}(k_S, k_S, k_L)}_{\gg 1} \left(\underbrace{\sqrt{\frac{\mathcal{P}_{\zeta_n} \mathcal{P}_{R_{\pi_0}}}{\mathcal{P}_{\zeta_n R_{\pi_0}}}}}_{O(1)} \right)^{k_L} \underbrace{A_s^{1/2}}_{4 \times 10^{-5}}$

(b) One-loop scalar-tensor-tensor bispectrum

(c) One-loop tensor two-point function in the presence of a classical scalar source.

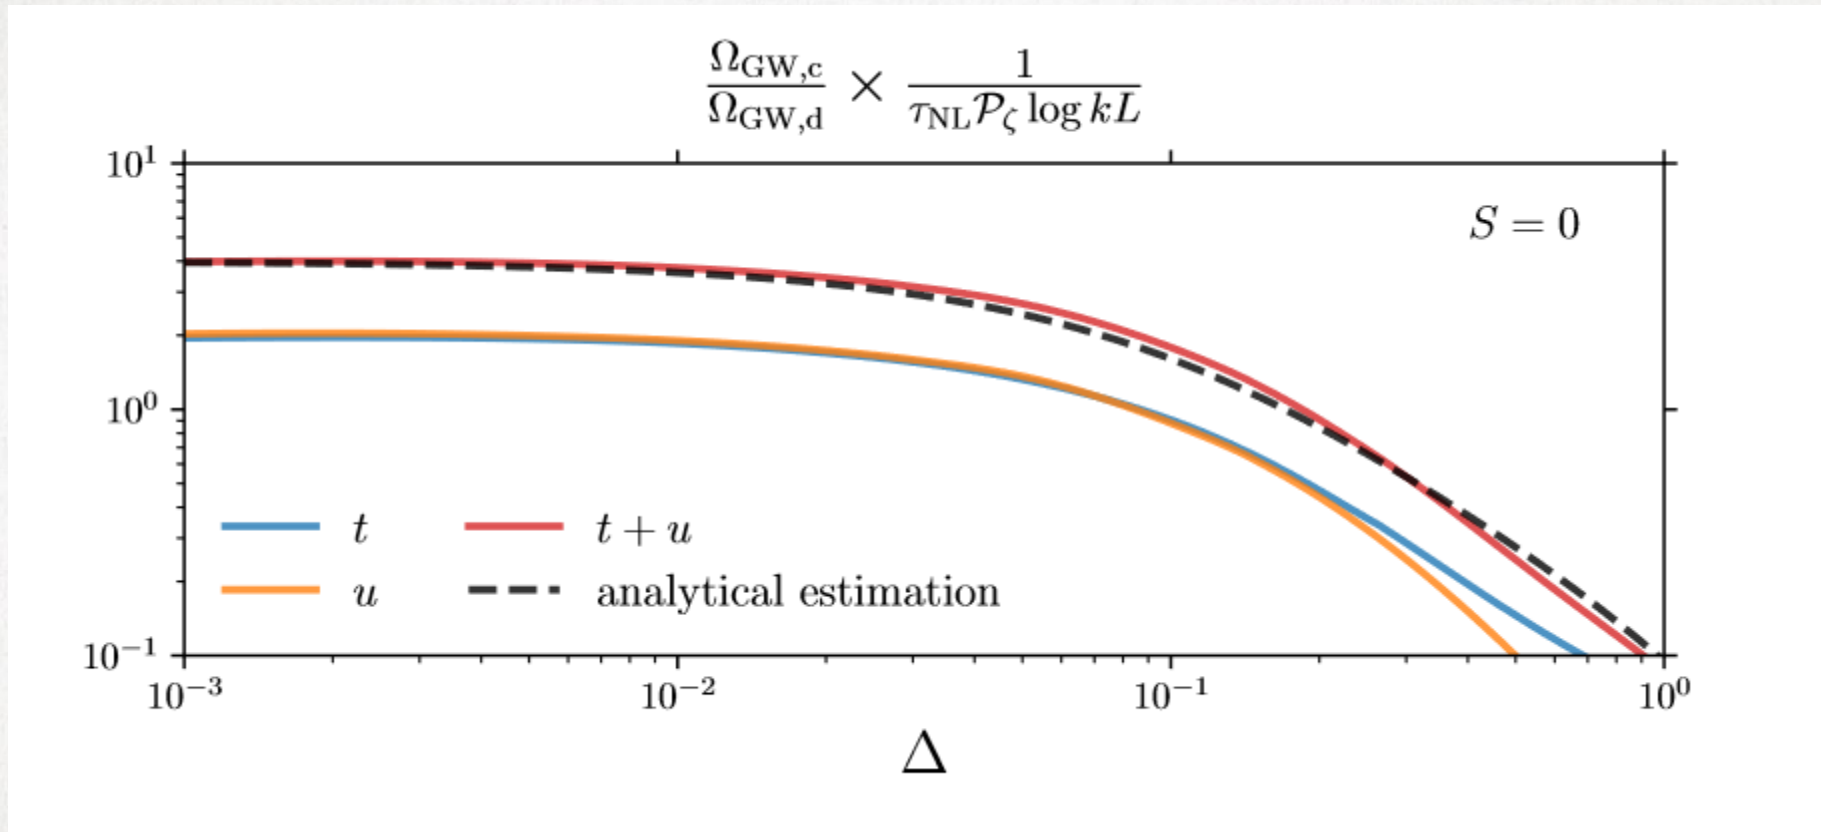

[Dimastrogiovanni, Fasiello, LP 2022]

ArXiv:2203.17192

BISPECTRUM IN MULTIFIELD INFLATION

The squeezed limit as a cosmological collider

Remember the single-field result:

$$f_{\text{NL}}^{\text{squeezed}} \propto n_s - 1 \ll 1$$

universal relation

Two-field result:

[Chen, Wang 2009]

[Noumi, Yamaguchi, Yokoyama 2013] (one extra heavy field $m_s > 3H/2$, perturbatively coupled)

[Arkani-Hamed, Maldacena 2015]

[Arkani-Hamed, Baumann, Lee, Pimentel 2018]

BISPECTRUM IN MULTIFIELD INFLATION

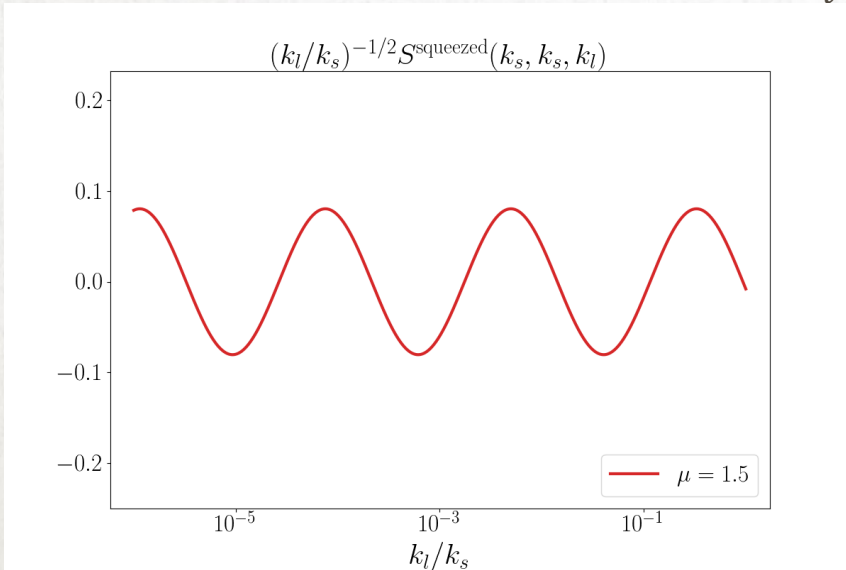

The squeezed limit as a cosmological collider

[Noumi, Yamaguchi,
Yokoyama 2013]

Two-field result: $f_{\text{NL}}^{\text{squeezed}} \simeq \eta_{\perp}^2 e^{-\pi\mu} \cos \left[\mu \log \left(\frac{k_l}{k_s} \right) \right]$ $k_l \ll k_s$

Small coupling between the two fields : $\eta_{\perp} \ll 1$

Oscillatory pattern: massive particle

$$\mu = \sqrt{\frac{m_s^2}{H^2} - \frac{9}{4}}$$

the reduced mass

Boltzmann suppression for heavy particles

$$H/2\pi \sim T \text{ so } e^{-\pi\mu} \sim e^{-\frac{m_s}{T}}$$

BISPECTRUM IN MULTIFIELD INFLATION

Probing other regimes

- Large coupling, $\eta_{\perp} \gg 1 \rightarrow$ Multifield instability \rightarrow Large flattened NGs:

[Fumagalli, Garcia-Saenz, Lucas Pinol,
Renaux-Petel, Ronayne 2019]

Phys. Rev. Lett. 123, 201302

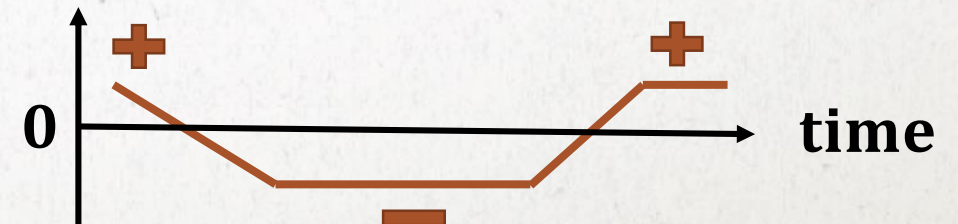

$$f_{\text{NL}}^{\text{flat}} = \mathcal{O}(50)$$

Higher-order correlation functions are boosted in similar configurations

$$g_{\text{NL}}^{\text{flat}} = \mathcal{O}(10^5) \text{ etc.}$$

$$m_{\text{eff}}^2/H^2$$

Clear sign of transiently unstable degrees of freedom:

BISPECTRUM IN MULTIFIELD INFLATION

Probing other regimes

- Large mass, $|m_s^2| \gg H^2 \rightarrow$ Single-field effective theory for ζ
(including the instability with $m_s^2 < 0$)

$$f_{\text{nl}}^{\text{eq}} \simeq \left(\frac{1}{c_s^2} - 1 \right) \left(-\frac{85}{324} + \frac{15}{243} A \right)$$

Speed of sound:

Dictated by the bilinear coupling η_{\perp}

[Achucarro, Gong, Hardeman, Palma, Patil 2012]

Single-field effective interactions

Dictated by the multifield cubic interactions

[Garcia-Saenz, Lucas Pinol, Renaux-Petel 2019]

J. High Energ. Phys. **2020**, 73 (2020)

THE EFT OF INFLATION

REVISITED...

Bottom-up approach: unknown natural values of the coefficients

[Cheung, Creminelli, Fitzpatrick, Kaplan, Senatore 2009]

$$S_3^{\text{EFT}}[\zeta] = \int d\tau d^3x a^2 M_p^2 \frac{\epsilon}{\mathcal{H}} \left(\frac{1}{c_s^2} - 1 \right) \left(\zeta' (\partial_i \zeta)^2 + \frac{A}{c_s^2} \zeta'^3 \right)$$

with $A = \mathcal{O}(1)$ but **undetermined**

THE EFT OF INFLATION

REVISITED...

In our top-down approach we **DERIVE** those coefficients

$$S_3^{\text{EFT}}[\zeta] = \int d\tau d^3x a^2 M_p^2 \frac{\epsilon}{\mathcal{H}} \left(\frac{1}{c_s^2} - 1 \right) \left(\zeta' (\partial_i \zeta)^2 + \frac{A}{c_s^2} \zeta'^3 \right)$$

$$\text{with } A = \underbrace{-\frac{1}{2}(1 + c_s^2)}_{\text{Previously known}} + \underbrace{\frac{2}{3}(1 + 2c_s^2) \frac{\epsilon R_{\text{fs}} H^2 M_p^2}{m_s^2}}_{\text{Scalar curvature of the field space}} - \frac{1}{6}(1 - c_s^2) \left(\underbrace{\frac{\kappa V_{;SSS}}{m_s^2}}_{\text{3rd derivative of the potential}} + \underbrace{\frac{\kappa \epsilon H^2 M_p^2 R_{\text{fs},s}}{m_s^2}}_{\text{Derivative of the scalar curvature}} \right)$$

Previously known

3rd derivative of the potential

Scalar curvature of the field space

Derivative of the scalar curvature

[Garcia-Saenz, Lucas Pinol, Renaux-Petel 2019]

J. High Energ. Phys. **2020**, 73 (2020)

Bending radius of the trajectory: $\kappa = \sqrt{2\epsilon} M_p / \eta_{\perp}$

BISPECTRUM IN MULTIFIELD INFLATION

Probing more than one extra field

[Lucas Pinol 2020]

J. Cosm. & Astro. Phys. 04(2021)048

➤ I extended previous works for any number N_{field} of kinetically coupled scalars:

- Most generic cubic action for perturbations at lowest order in derivatives

$$\begin{aligned}
 \mathcal{L}^{(3)} = & M_p^2 a^3 \left[\epsilon(\epsilon - \eta) \dot{\zeta}^2 \zeta + \epsilon(\epsilon + \eta) \zeta \frac{(\partial\zeta)^2}{a^2} + \left(\frac{\epsilon}{2} - 2\right) \frac{1}{a^4} (\partial\zeta)(\partial\chi)\partial^2\chi + \frac{\epsilon}{4a^4} \partial^2\zeta(\partial\chi)^2 \right] \\
 & + a^3 \left\{ \sqrt{2\epsilon} \omega_1 M_{\text{Pl}} \left[\frac{\mathcal{F}^1}{H} \left(\frac{(\partial\zeta)^2}{a^2} - \dot{\zeta}^2 - \dot{\zeta}\zeta H (\eta + 2u_1) \right) + 2 \frac{\Omega_{1\alpha}}{H} \dot{\zeta}\zeta \mathcal{F}^\alpha \right] \right. \\
 & + \left[\frac{\epsilon}{2} m_{\alpha\beta}^2 + \frac{(\dot{m}_{\alpha\beta}^2)}{2H} + \Omega_{\gamma\beta} \left(\epsilon \Omega^\gamma{}_\alpha + \frac{\dot{\Omega}^\gamma{}_\alpha}{H} - \frac{m_{\gamma\alpha}^2}{H} \right) \right] \zeta \mathcal{F}^\alpha \mathcal{F}^\beta + \epsilon \Omega_{\alpha\beta} \zeta \dot{\mathcal{F}}^\alpha \mathcal{F}^\beta \\
 & + (2\epsilon H^2 M_{\text{Pl}}^2 R_{\alpha\sigma\beta\sigma} - \omega_1^2 \delta_{\alpha 1} \delta_{\beta 1}) \frac{\dot{\zeta}}{H} \mathcal{F}^\alpha \mathcal{F}^\beta + \frac{1}{2} \epsilon \zeta \left((\dot{\mathcal{F}}^\alpha)^2 + \frac{(\partial\mathcal{F}^\alpha)^2}{a^2} \right) \\
 & - \frac{1}{a^2} (\partial\mathcal{F}^\alpha)(\partial\chi) (\dot{\mathcal{F}}^\alpha + \Omega_{\alpha\beta} \mathcal{F}^\beta) + \frac{2}{3} \sqrt{2\epsilon} H M_{\text{Pl}} R_{\alpha\beta\gamma\sigma} \dot{\mathcal{F}}^\alpha \mathcal{F}^\beta \mathcal{F}^\gamma \\
 & \left. - \frac{1}{6} \left(V_{;\alpha\beta\gamma} - 4\sqrt{2\epsilon} H M_{\text{Pl}} (\omega_1 \delta_{\alpha 1} R_{\beta\sigma\gamma\sigma} + \Omega^\delta{}_\alpha R_{\delta\beta\gamma\sigma}) + 2\epsilon H^2 M_{\text{Pl}}^2 R_{\alpha\sigma\beta\sigma;\gamma} \right) \mathcal{F}^\alpha \mathcal{F}^\beta \mathcal{F}^\gamma \right\} \\
 & + \mathcal{D},
 \end{aligned} \tag{3.10}$$

} single-field (recovering Maldacena)
 } \geq two fields
 } \geq boundary terms (they contribute!)

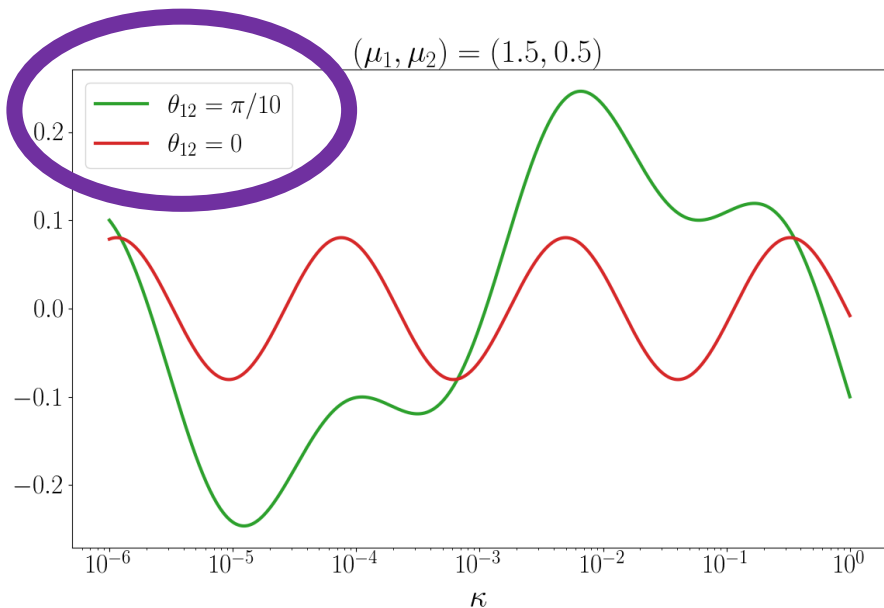

BISPECTRUM IN MULTIFIELD INFLATION

Probing more than one extra field

[Lucas Pinol 2020]

J. Cosm. & Astro. Phys. 04(2021)048

- I extended previous works for any number N_{field} of kinetically coupled scalars:
 - Most generic cubic action for perturbations at lowest order in derivatives
 - In the case of heavy fields, integrating out procedure still possible
 - We can probe many-fields interactions in the squeezed limit

[LP, Aoki, Renaux-Petel, Yamaguchi 2021]

ArXiv:2112.05710

Interesting features:

- ❖ Several extra massive fields lead to modulated oscillations
- ❖ Light fields or light and heavy also lead to characteristic signals
- ❖ Theory described with **mixing angles** for flavour and mass eigenstates

Inflationary flavour oscillations
